Business and Lersonal.

The Charge for Insertion under this head is \$1 a Line. State and County Rights for Sale of a valuable Patent used in every family. Send for circular. Address Krumscheid & Benz, 155 Shawmut Avenue, Boston, Mass.

\$300 Cash will buy the entire right for the best patent Clothes Line Holder in the world. Sample sent, postpaid, for 10 cents. Address C. L. T., P. O. Box 773, New York.

Lathes, Planers, Drills, Milling and Index Machines. Geo. S. Lincoln & Co., Hartford, Conn. I wish to arrange with some reliable manu

facturer to make or buy a valuable Patented Tool. Address C. E. Littlefield, Vinal Haven, Knox Co. , Maine.

Planes-Spencer's Iron Throat Plates. Applicable to all wood planes. Makes an old plane better than new. Planes cross-grained wood perfectlysmooth. Dispenses with cap, works third easier, never clogs. Adds to durability and appearance. Samples 75 cents postage paid, with directions. Send for circular. Gervis & Co., Phelps, N.Y.

Iron Planer Tables and Beds, large sizes— Second hand-wanted. Also Old Planers complete. Ad-dress Box 601, Quincy, Illinois.

Williamson's Road Steamer and Steam Plow with rubber Tires. Address D. D. Williamson, 32 Broad' way, New York, or Box 1809.

Wanted—A City or Town that will offer inducements for the location of an established manufacturing business. Address "Fire Engines," 70 Columbia Street, Newark, N.J.

Manufacturers of Malleable Cast Iron Plow Clevises, also Wrought Iron do., please address Buckley & Ellis, Pottstown, Pa.

Half or whole interest in Patent for Small Wares wanted. Address P. O. Box 760, Madison, Ind.

Nickel and its Uses for Plating, with gene-ral description. Price 50c. a copy, mailed free, by L. & J. W. Feuchtwanger, 55 Cedar Street, New York. ral descr

How to construct Mill Gearing, 50 cts. E. Lyman, New Haven, Conn.

Catalogue on Transmission of Power by Wire Rope. T. R. Bailey & Vail.

No Bolts, no Keys, no Set Screws used in Coupling or Pulley Fastening. Shortt's Patent Couplings, Pulleys, Hangers and Shafting a Specialty. Orders promptly filled. Circulars free. Address Shortt Manu-facturing Company, Carthage, N. Y.

Cabinet Makers' Machinery. T.R.Bailey&Vail. Buy Steam Engines and Boilers of Gear,

Machinery at the Vienna Exposition. See the Vienna correspondence of the Boston Journal of Commerce, \$3 a year.

Freeland Tool Works (late A. M. Freeland), 560 West 34th St., N. Y. Machinists' Tools a specialty.

Improved Automatic Hub Mortiser, Hub Turner, Hub Borer, Spoke Lathe, Tenoner, Throater and Spoke B.lting Machinery. Address Defiance Machine Works, Defiance, Ohio.

Belting—Best Philadelphia Oak Tanned. C. W. Arny, 301 and 303 Cherry Street, Philadelphia, Pa. Stave & Shingle Machinery. T.R.Bailey & Vail.

For Solid Emery Wheels and Machinery, soud to the Union Stone Co., Boston, Mass., for circular. All Fruit-can Tools, Ferracute, Bridgeton, N.J.

Buy Gear's Improved Balanced Jig Saw, Boston, Mass

The Ellis Vapor Engines, with late improve-ments, manufactured by Haskins Machine Company, Fitchburg, Mass.

The Best Smutter and Separator Combined in America. Address M. Deal & Co., Bucyrus, Ohio.

Damper Regulators and Gage Cocks-For e best, address Murrul & Keizer, Baltimore, Md. the best

The Berryman Heater and Regulator for Steam Boilers—No one using Steam Boilers can afford to be without them. I. B. Davis & Co.

Brown's Coalyard Quarry & Contractors' Ap-paratus for hoisting and conveying material by iron cable, W.D. Andrews & Bro. 414 Water st. N. Y.

Five different sizes of Gatling Guns are now manufactured at Colt's Armory, Hartford, Conn. The larger sizes have a range of over two miles. These arms are indispensable in modern warfare.

Gauge Lathe for Cabinet and all kinds of han-dles. Shaping Machine for Woodworking. T. R. Bailey dles. Shaping Machine i & Vail, Lockport, N. Y.

The Berryman Manuf. Co. make a specialty of the economy and safety in working Steam Boilers. I. B. Davis & Co., Hartford, Conn.

¹ Root's Wrought Iron Sectional Safet v Boiler, 1,000 in use. Address Root Steam Engine Co. 2d Avenue and 23th Street, New York.

Grain, Paint, Ink, Spice and Drug Mills. Ross Bro's, 85 First Street, Williameburgh, N. Y.

Drawings, Models, Machines—All kinds made to order. Towle & Unger Mf'g Co., 30 Cortlandt St., N.Y. Key Seat Cutting Machine.T.R.Bailey & Vail.

te oles & Queries

J. N. F. asks: Is there any cheap white metal, of which castings can be made, that will not melt and that can be furnished as cheaply as common gray iron? Something similar to white wire clothes line is wanted.

E. E. M. asks: If a glass tube $\frac{1}{5}$ inch in diameter contains 1 lb. of mercury, what would be the pressure on a piston fitted to such a tube for every degree of heat applied?

J. F. C. says: I wish to kill some large trees before cutting them down. What solution can I use for the purpose?

R. H. A. says: An oscillating piston, 2 feet long by 1 foot wide, vibrates on a rock shaft within a properly constructed chamber. Where, in its length, is the location of its average power? The speed, of course, is an element in the calculation, but does not vary the point of average delivery, be it much or little.

G. J. says: I heard a man say a few even-ings since that he was the party sent by a firm in England to fit up the first self acting lathe, drill press, and slot-ting machine that was in any of the Eastern States. Whet melase me doubt him is that he is a man mot own What makes me doubt him is that he is a man not over 50 or 55 years of age. Can you give the name of the party who first had the above-mentioned in that section of the country, where they came from, and who fitted them up? [We must ask some of our readers to answer this question for our correspondent, and thereby settle a question about which there is a great deal of dispute. There are many claimants even for the invention of the slide rest. It was described in a patent by Sir Samuel Bentham of England, in 1793, but is claimed to have been first introduced by Mr. Henry Maudsley.]

S. asks what is the best and simplest mode of measuring power? Answer: There are quite a num-ber of dynamometers in the market, for measuring the power transmitted by a shaft or pulley. Where it can be applied, the ordinary Prony brake is the best. The power of an engine can be determined quite accurately by the use of the indicator. As you do not give particu-lars, we cannot tell what is the best method for you to employ

C. H. A. asks: Should a tightening pulley be placed as close as possible to the driving pulley, with-out regard to the relative size of the driven pulley, or near the smaller of the two pulleys, whichever that may be, in order to increase the amount of contact? It is conceded that, in case of the driving pulley being the larger and the belt being liable to slip on the smaller, the tightener should be put about midway between them. But it is asserted that it consumes more power Nye's Sperm Sewing Machine Oil is the Best when placed near the driven than when close to the nthe world. Sold everywhere in bbls, half bbls, cans and driver. Is it so, and, if so, why? Answer: The loss of bottles, at lowest prices. W. F. Nye, New Bedford, Mass. power occasioned by the use of a tightener is the power power occasioned by the use of a tightener is the power required to bend the belt under that pulley, and to drive the julley. It would appear, then, that by placing the tightener near the smaller pulley, there is a greater loss than when it is close to the larger, since the belt requires to be more bent in the former case. This would indicate that the best place to put a tightener is as close to the larger pulley as it can be arranged, to have it work satisfactorily.

> J. B. T. asks: Why is it that engineers, fremen and conductors, jumping from moving trains, invariably jump in the direction of the moving train? say that there would be less danger in jumping in a contra-ry direction from a vehicle whose speed is equal to that at which a man might jump, which, by the way, is greater than most people are aware of. Supposing I am able to jump at the rate of 10 or 15 miles per hour; if I jump from a moving vehicle of the same rate of speed, in a contrary direction to the moving train, one motion destroys the other and gravity brings me in a vertical line to the earth. Answer: Our correspondent forgets that, although he might be able to jump at the rate of a mov-ing vehicle if starting from a position of rest, it would be very different, if he were to attempt to do the same thing from the vehicle when it was in motion. Hisbody would then be in motion, and it would be necessary to overcome the inertia or resistance to motion in a con trary direction. The amount of work necessary to be overcome would be half the mass of his body, multiplied by the square of the velocity of the vehicle. We imag ine that it is because they have found, by experience that they cannot make one motion destroy the other that conductors and others jump off in the direction of the moving vehicle.

R. A. C. says: 1. Last fall, while riding along in West Tennessee by a black locust thicket, I observed that the trees were killed, root and branch. Not a living sprout did I see. I enquired of the owner how he didthis. He stated that on June 22 and 23 he skinned round the trees, taking the bark from the body of the trees all round, leaving a bare space a bout 12 inches long. Key Seat Cutting Machiner, R. Darley & Van. Cheap Wood-Working Machinery. Address M.B. Cochran & Co., Pittsburgh, Pa. Peck's Patent Drop Press. For circulars, address Milo, Peck & Co., New Haven, Conn. Steam Fire Engines, R.J. Gould, Newark, N.J. Sure cure for Slipping Belts—Sutton's pat-ent Pulley Cover is warranted to do double the work before the belt will slin. See Sci. Am. June 2ist. 1873. Cheap Wood-Working Machinery. Address Way. I chopped around some honey locust last August; and where the work was well done, the trees are dead: but I am still waiting to see if it is a fact that they are killed root and branch. Is this so? 2. Howmanylbs. of Pitts-burgh coal will do the work of one cord of good oak wood, all things being equal? The object is economy in fuel. 3. Is the coal more liable to injure a heavy2flue before the belt will slip. See Sci. Am. June21st, 1873, charcoal iron boller than wood? 4. What is the best Page 389. Circularsfree. J. W. Sutton, 95 Liberty St., N.Y. knownremedy for bleeding at the nose? Answers: 1. It is Mining, Wrecking, Pumping, Drainage, or generally supposed that winter is the best season in Irrigating Machinery, for sale or rent. See advertisement, which to girdle trees to kill them. We would be glad to Andrew's Patent, inside page. hear from some of our readers who havecleared landby girdling thetrees. 2. About1,500 lbs. 3. The coal is not more liable to injure the boiler than the wood is. 4. Probably every one thinks his own remedy is the best and we must ask our readers, who know of efficient rem edies, to favor us with communications. The best rem edy of which we have heard is for the person who is afflicted to lie down on his back, without a raised sup-port for his head. Of course, this might not prove to be a universal cure, as specifics are exceedingly rare. A. L. B. asks: 1. Is there any industrial school in your city or vicinity that prepares men for mechanical engineers without their taking full collegiate. scientific, or classical courses, and of a not very expension sive character? 2. Can a man in New York earn suffic ient money during the first year at the machinist's trade to support himself? 3. Is there any market in this part of the country for scrap tin? Answers: 1. You may take a free course in mechanical engineering at the take a free course in mechanical engineering at the Cooper Union, but the instruction is given in the even-ings only. At the Stevens Institute, Hoboken, they

take special students in mechanical engineering, as also at the Polytechnic College, Market St., Philadelphia. Write to any of these for catalogue and list of studies. 2. Probably not, if you are an apprentice and just bawith the trade, yes. 3. Yes.

N. J. F. asks: 1. What is the amount of power to be obtained from a flow of water through an orifice 1 foot square? The water is to be taken out of a canal whose surface is 13% feet above the river, into which the water used for power is to waste. 2. What is the difference between fixing the measuring orifice (1 *arbor vita* timber as suitable for that purpose as the mersed surfaces of the smaller vessels. You can readily juniper of the Dismal Swamp? Answers: 1. With the make the calculation for any assumed dimensions. measuring or fice at the top, the useful effect of the water will be about eight horse power. 2. When the orifice is at the bottom of the flume, more water will be willbe much increased. 3 Yes. 4. You can only tell by constructing a bucket of *arbor vitæ* timber, and try-ing it. Generally, the *arbor vitæ* tree is too small to be worked profitably for such purposee worked profitably for such purposes.

E. H. B. asks: 1. What is the commercial value of pyroligneous acid and of tar produced by burning charcoal in kilns? 2. What is the best method of securing and storing it for market? 3. What gases are generated by the slow combustion of wood in coal kilns? 4. Can clay pipes, burned like ordinary brick, berendered sufficiently non-porous to hold and convey water under pressure: and what would be the best material to render the joints watertight? Answers: 1. It depends upon quality and distance from market. 2. When charcoal is burned in heaps, the acid cannot so easily be secured. Retorts are best adapted to the preparation of pyroligneous acid, but kilns or ovens built of brick, with a pipe for carrying off volatile products of distilation, can be employed. In Russia the wood is heaped up on a plot of ground which is somewhat elevated above the level of the soil, and is funnel shaped, the whole being constructed of clay and lined with roofing tiles, on which the tar collects and flows off into a vessel placed in the vault beneath. The wood, generally of coniferous trees, is heaped in 6 to 8 inch layers, and is first covered with hay or dung, next with a layer of a few inches in thickness of sand or earth. The wood in the heap is ignited at the bottom, where 40 to 50 apertures are left in the covering; these apertures being closed with wet sand as soon as the combustion of the wood becomesactive and hasspread through the whole heap. After 10 or 12 days the tar begins to collect and is removed daily. The smouldering continues 3 to 4 weeks, and the quantity of charcoal obtained is very small. Illustrations of the various forms of kills employed will be found in Wag-ner's "Chemical Technology." It may be converted into acetate of lime before sending it to market. 3. The gaseous product of dry distillation is a mixture of infiammable gases, the most important of which are marsh gas and olefant gas. Where wood is very cheap, illumina-ting gas is prepared in this way. 4. The chimneys are probably thicker in one place than in another. Try an-nealing by placing in cold water and slowly heating to boiling; and after boiling some time, cool slowly. 4. By glazing them in the usual way before burning, or by coatingwith water glass or asphalt, they will be rendered water tight. Try the experiment on **a** short distance first. Use hydraulic cement for the joints.

S. L. D. asks what is the best, cheapest and most easily applied substance for blasting. "The rock I want to blast is inside a mill; 20 feet above are machinery, millstones, etc.; the space is 10 x 40 feet, and is enclosed by strong stone walls. I have heard dynamite spoken of as cheaper, more powerful in its effects, and quite as safe as powder. Please inform me if this is so; also how to put it up. Should it be in waterproof cartridges? How is it operated, what quantity is used and who wis it fired? Where can it be obtained? Answer: We cannot recommend dynamite as safer or better for your use than powder. It is put up in cartridges, but we are unable to designate dealers to whom you should apply. See notice under "Communications Received."

W. O. D. asks what preparation can be used to remove varnish from the surface of an oil painting without injuring the picture. "I know that it can be done." Answer: In order to remove the cracks often observed in old pictures, and which we presume to be your object, Van Pettenkofer has suggested exposure to the vapor of alcohol at the ordinary temperature of the air, the picture being piaced in an air-tight box, at the bottom of which is a tray containing alcohol. In some cases, however, it is unsuccessful. One of the best solvents of dried paint and of boiled oil varnishes is a mixture of alcohol and chloroform.

T. W. S. asks what will prevent four paste from getting sour, or arrest fermentation? Answer Flour paste will not sour or ferment if a little alcohol be added to it. Carbolic acid will also preserve it, but to many people the smell of the latter is so objectionable that they prefer the more expensive alcohol.

M. W. B. says: I wish to know what will clean and polish the brass work on a locomotive better and quicker than the oil and emerygenerally used. Answer: Use oxalic acid, in the form of powder, applying it with a piece of dry waste. This is a poisonous com pound.

W.S.J. asks: 1. Can I melt old rubber boots in a mixture of pitch, asphaltum and shellac; that is to say, will the rubber be dissolved when boiled in this mixture? 2. Can waterproof clothing (such as has been waterproofed with alum and sugar of lead) be ironed when damp to take out the wrinkles without spoiling the waterproof quality? Answers: 1. No; the rubber must first be dissolved in bisulphide of carbon, and as the quantity of rubber required is very small, it would be cheaper to purchase the crude caoutchouc be fore it is vulcanized. 2. No doubt it can.

ous, under ordinary conditions: but it is not generally considered advisable to blow off while feeding a boiler, because, as feed and blow pipes are usually arranged, the clean water that is forced in by the pump is blown ginning to learn the machinist trade. If acquainted off, not having time to mix with the other water in the boiler.

T. J. says: Does water offer less resistance to one large ship than to an equal bulk comprised in several smallerships of the same shape? Answer: The resistance of the water is made up of resistance to greatest immersed cross section and skin resistance, the latter depending upon the amount of wet surface. foot square) at the top of the flume and at the bottom The large ship, having the bulk of several smaller ones of it? 3. Is the manufacture of red cedar into buckets could probably be arranged with less cross section and or pails generally considered a paying business? 4. Is less wet surface than the sum of cross sections and im-arbor vitæ timber as suitable for that purpose as the mersed surfaces of the smaller vessels. You can readily

> M. J. S. asks: 1. How is the nitrate of gold produced, which is employed in electro-plating? Is it gold leaf dissolved in *aqua regia*? If not, what is it? is used for electro-plating. When gold is dissolved in aqua regia, the chloride of gold is formed. Dissolve 7 grains of very fine gold in aqua regia, evaporate the solution to dryness on a water bath, and dissolve the residue in distilled water, then add to this solution some cyanide of potassium. (See also answer to W. A. B. in last week's issue.) 2. Ordinary glue, or a cement made as follows: Soak white glue in hot water; warm the jelly formed, add enough pulverulent slaked lime to give it consistency. The object to be cemented is to be slight-ly warmed. Another cement is shellac dissolved in borax.

> F. E. C. asks: 1. How can I make a cruci-ble for melting brass? 2. How can I make a mold for casting brass? 3. How can I cast lead pipes? Answers: 1. You can make the crucible of clay, and line it with fine coal dust, 2. Use ordinary molding sand, and either a metal or wooden flask. 3. For short pieces of pipe, use wooden molds and wooden cores. Make the core in two pieces, cut at an angle, so that it can be withdrawn from the casting.

> II. II. asks: What is the best and surest means of Cleaning old boiler flues from dirt and scales without removing them from the boiler? Answer: Our correspondent does not state the nature of the scale; but in ordinary cases we would advise the use of tannate of soda, which is highly recommended by many who have tried it.

> P. T. R. asks: What kind of lenses and how many are used in a magic lantern, and how are they arranged in the tube? Can there be a lantern or camera made which will show any opaque object, such as a com-mon photograph, a steel engraving or a coin, upon a screen," in its natural colors? If such a camera can be made, please give a description of it. Answer: One double convex lens is required in the tube. The magic lattern will show images of opaque objects with their colors on the screen, and beautiful effects are produced if the objects are strongly illuminated.

> L. H. asks: How can I make a small en-gine to drive on a common road? How large a boiler and engine will it take to carry two persons? If one could be made, would the against the law to drive it in the road? Answer: The engine and boiler should be designed to give a useful effect of about one horse power. Road steamers have occasionally been used in this country; and we believe no objection has been made by the authorities, probably on account of their novelty. You will find a very interesting paper on road steamers, by Professor R. H. Thurston, in the Journal of the Frank-lin Institute, for January, 1873. An abstract of the paper has been published in the SOIENTIFIC AMERICAN.

> MINERALS .- Specimens have been received from the following correspondents, and examined with the results stated:

> J. N. M.-Ironpyrites and sulphate of lime are the minerals you send—of no value. If a stream flows from the spring you can, by means of a water ram, send up water into your house, thirty feet high or more. Apply to prominent booksellers for works on cultivation of trees.

> J. G. W .- It is galena or sulphide of lead, a rich and aluable ore, containing about 86 per cent of lead. J. H. S.-Chiefiy iron pyrites.

A. G.-Iron pyrites.

G. B.B.-Red hematite and sulphur. The value of the latter depends on its distance from a market.

 $J.\,J.\,T.{-}{\rm Red}$ hematite, an ore of iron, valuable if no too far from coal mines and transportation.

G. R. E. G.-One specimen contains some iron pyrites quartz, etc., but nothing of value. The others are magnesian limestone and iron ore.

G. C. P .- The soft substance had become quite hard by the time it reached us, and most of it was infusible and insoluble, like quartz. It also contained some organic matter.

COMMUNICATIONS RECEIVED.

The Editor of the SCIENTIFIC AMERICAN acknowledges, with much pleasure, the receipt of original papers and contributions upon the following subjects:

Machinists-Price List of small Tools free; ear Wheels for Models, Price List free; Chucks and Drills, Price List free. Goodnow & Wightman, 23 Cornhill, Boston, Mass.

The Berryman Steam Trap excels all others. The best is always the cheapest. Address I. B. Davis & Co., Hartford, Conn.

For best Presses, Dies and Fruit Can Tools, Bliss & Williams, cor. of Plymouth & Jay, Brooklyn, N.T.

For Solid Wrought-iron Beams, etc., see ad-vertisement. Address Union Iron Mills, Pittsburgh, Pa., for lithograph, etc.

Parties desiring Steam Machinery for quar-rying stone, address Steam Stone Cutter Co., Rutland, Vt.

Hydraulic Presses and Jacks, new and second hand. E. Lyon, 470 Grand Street, New York.

Rubber Machinery of all kinds manufac-tured by W. E. Kelly, New Brunswick, N. J.

Boring Machine for Pulleys-no limit to capacity. T. R. Bailey & Vail, Lockport, N. Y.

W. & R. say: How shall we learn what the Whitworth screwthread is, so as to be able to make it with precision? Answer: See editorial pages of last week's issue.

W. M. W. would like to know a way of re-moving sperm (such as is used in making candles) from clothing. Answer: A hot iron and a piece of brown paper will soon extract the sperm. Benzine will also emove it, but it occasionally affects the color.

W. H. B. asks: Which is the most accuate, a long or short bubble in a common spirit level? Answer: The best length of bubble depends somewhat on the length or curvature of the tube, a short bubble being required for a tube withsmallradius of curvature, and increasing regularly in proportion with the increase of the radius of curvature.
