- W. H. H. says: We have a steam engine power, and a muley saw lbs. steam, we cannot run through a 30 inch log, the saw making 200 revolutions per minute. I would like to increase the heating surface. At present we have onlygot an inch and a quarter pipe running through heater 20 inches long. Suppose I turn the exhausthrough the tank, will it deduct anything from the power of the engine? A. It will increase the back pressure slightly. We do not answer questions of the character of your other queries for obvious reasons.
- J. W. C. asks: How can I make bronze and blue writing inks? A. For blue, use 2 ozs. Chinese blue, boiling water 1 quart, acetic acid 1 oz. Dissolve the blue in the water, add the acid, and it is ready for use. For bronze, use the common blue ink of the shops in a steel pen; it will turn bronze by the action of the
- J. H. P. says: It is generally believed that a railroad bridge is less liable to give way when the passing train moves slowly than when under full speed.

 Is this correct? Boys sliding or skating over thin ice rightly judge their safety to depend in a great measure upon the celerity of their movement. Grant that a bridge has one weak place, one place weaker than any other of the same bridge; and that a train has one can or combination of cars heavier than any other car or combination of cars of the same train; and further that there is one point (center of gravity) in that heavy car or combination of cars where the strain or gravit; is greater than at any other point. Now, as it is the last straw that breaks the camel's back, so by parity of reasoning it is that point of greatest strain or gravity that causes the bridge to give way at the weakest place Again, grant that a bridge never falls to pieces all at once, but that in the order of time one part-pin, brace or beam-breaks first, then another part, then another till the final smash, each break occupying, succeeding, and being succeeded by an appreciable moment of time; and further, the more rapidly the train moves, the more evenly the greatest strain will be distributed over the bridge and the less time it will have to act upon the weak point; and it follows, other considerations being out of the question: That the more rapidly the train passes over the bridge, the less liable will be the bridge to fall. Is this correct? A. This theory would be correct, if a train passed over the track as a boy glides over the ice on skates. But the train, on account of inequalities in the track and uneven speed, is coninually striking blows as it moves along; and the faster moves, the more rapid and violent are the blows.
- ▶ 1€. T. D. asks: How is the crystalline ap pearance of galvanized sheet iron produced? A. W believe that it is produced by the crystallization which takes place in the cooling of the zinc surface on with drawing the iron plate from the bath of molten metal.
- J. K. R. asks: At what temperature will plumbago fuse, or what degree of heat will it sustain without fusing? A. It will not fuse at, and should sus tain, the highest heat of a wind furnace.
- W. C. K. asks: How can I prepare common cotton sheeting, so that it will be sufficiently close to use for a sail? Without some preparation it will not hold the wind. A. Try a thin solution of india rubber in bi sulphide of carbon.
- A. E. G. asks: Will you give me a test for the presence of alcohol in solutions? A. Pure alcohol must completely volatilize, and ought not to leave the least smell of fusel oil when rubbed between the hands nor should it redden litmus paper. When kindled, it must burn with a faint bluish, scarcely perceptible
- G. O. S. says: I am building a small pleasure steamer to draw 2 feet of water. What tunnage will she carry? Her length is 47 feet, beam 4 feet, with flat bottom? A. Calculate the displacement, in cubic feet, for any draft, and divide by the number of cubic feet in a tun of water.
- €. H. asks: 1. What will rust iron the most and in the least time? A. A solution of salammoniac will answer. 2. What is the wax which the bar bers use for blacking the moustache composedof? A It generally contains a solution of nitrate of silver.
- J. W. M. asks: I. What is the rule for placing boiler rivets, and for the size of rivets to get the greatest strength in different thicknesses of iron? A It is usual, in single riveted joints, to make the diameter of the rivets from twice to once and a half the thickness of the plate. The distance between the centers of rivet holes may be found by adding the diameter of the rivet to 0.7854 times the quotient of the square of the diameter of the rivet divided by the thickness of the plate. 2. If we use a common horse power, run a lever 50 feet from center, and lay a 3 feet endless railroad 100 feet diameter, would it do for such heavy work as a 3 run flour mill? We should use a small locomotive for power. Would it be economical ornot? A. We do not see anything of special merit in the plan. 3. What is the size of the largest locomotive driving wheels, and on what railroad are they used? A. The largest of which we have seen an account are on some locomotives in the Great Western Railway in England. They are 8 feet in diameter.
- T. C. S.—The solution on p. 300, vol. 29, seems to be correct. The relation between the power and weight was required for a definite position of the machine; and though this relation is continually varying, it can be found, for any particular point very reliably. You will find the subject treated in any good work on mechanics, showing how to deduce general formu lae, by which weight at any point can be determined.
- T. F. asks: 1. What work on logarithms explains them in the plainest way, without regard to cost? A. We can recommend Law's "Treatise on Logarithms." arithms," published in Weale's series. 2. Is there any work in which the shafting and pulleys for quarter twist belts are illustrated? A. You will find this flus trated in nearly any book on mill work. 3. Which French scientific periodical is most like the Scientific AMERICAN? A. The Revue Industrielle. 4. Is there any one devoted to the flour milling interests? A. We think
- C. A. asks: 1. What is the best speed for a foot power circular saw, as proved by practice, the saw being 5 inches in diameter? A. As fast as possible. 2. Would it not require too much power to run the saw at 9,000 feet perminute, to saw one inch stuff? A. Yes. 3 Can you furnish the Science Record for the years 1873 and 1874? A. Yes.
- B. H. asks: What is the greatest speed that has been attained by a locomotive? A. The fastest time that we know of from personal observation is 63 miles an hour. We have seen statements, on apparently good authority, that a speed of 90 miles an houris of tenattained on many railroads in this country.

- W. H. B. asks: 1. What is meant by the term sea level, and how can I determine the sea level of any city? A. The sea level is the hight of the ocean, at meanlow tide, in reference to any place whose eleva-tion is to be determined. 2. What is the meaning and derivation of the term O. K.? A. We have been told that it originated from the endorsement put upon a package by a distinguished but illiterate personage. Being asked what he meant by "O. K.," he took a piece of chalk and wrote down "Orl Korrect."
- H. T. G.asks: Can air be so confined as to be used as a power? For instance, could it be applied to running a locomotive, provided a constant supply could be obtained? Has there ever been an air engine in operation? A. Air compressing machines, and the use of compressed air for motors, are quite common. You can get full particulars from the manufacturers.
- S. asks: Can the best turbine water wheel. geared to the best pump made, raise the quantity of water used by the wheel to % the hight of the fall? A. According to some of the best results given in tests of turbine wheels and pumps, the quantity of water raised would be 0.55 the hight of the fall with a centrifugal pump, and 0.45 with a direct acting pump.
- M. A. V. asks: How much water ought to be evaporated into steam of 60 lbs. per square inch pressure, by 1 lb. of ceke, using cold water to feed the boiler? A. About 7½ lbs., if the boiler is well de-
- J. H. asks: 1. Does the power of the ram increase as the square of the fall increases? A. No. 2. Is the power the result of the impetus acquired by the discharge? A. Yes. 3. Would it be practicable to work a ram under a head of twenty feet? A. Yes.
- C. S. A. asks: 1: If a pipe is forty feet high and filled with water, what will be the pressure to the square inch on the base? What is the rule for telling the pressure of water on the base, the tube being of a specified hight? A. Multiply the hight in feet by 0 433. In the example given, the pressure per square inch on the base is $40\times0.438=17.32$ pounds. 2. When the steam gage registers 60 lbs., does that mean that there 1860 lbs. pressure to the square inch of surface of the boiler? A. Yes. 3. How many gallons of water does an ordinary locomotive carry in its tender? A. From 1,500 to 2,000, 4. How is the expansion and contraction provided for in the bridge at St. Louis? Will wire rope work over six inch pulleys subjected to heavy pressure stand the pressure and wear as well as the ordinary cable? A. See answers to C. B. A., p. 34, vol. 30.
- A.M.Y. asks: Can you recommend me any works on armored vessels? A. It will be necessary for you to look over periodical literature. You will find some matter of considerable value in "Our Iron-Clad Ships," by E. J. Reed.
- M. asks: 1. Is there any difference between one square foot and one foot square? A. No. 2. Is it correct to say that one square foot is equal to four feet source? A. No. 3. A contends that one foot square and onesquare foot are equal, and that four feet square contains sixteen square feet. A. The statement is cor-
- $R.\ asks:\ How can\ I\ get\ at\ the\ exact latitude of a place in the vicinity of Lake Connecticut,$ N. H.? A. It is most readily calculated from observations of the meridian altitude of the sun or a star. It can be ascertained, with sufficient accuracy for many purposes, by the inspection of a good map.
- C. V. H. asks: 1. Will nickel coating disturb the temper of steel wire? A. No. 2. Will coiling the wire for springs injure the nickel coating? A. Yes. 3. What is the expense of nickeling steel wire compared to the market value of the same? A. From 25 to 100 per cent, according to size and quality.
- J. H. W. asks: What is the nature and amount of friction on a ship propelled through the water by steam or wind? A. You will find the subject treated in Bourne's "Handbook of the Steam Engine." Its discussion would occupy too much space for inser tion in these columns.
- MINERALS, ETC.—Specimens have been received from the following correspondents, and examined with the results stated:
- T. J. M.-No salts of any kind, nor any sizing, have been used in the manufacture of this article. It appears to owe its character to the way in which vegetable fibers like hemp have been worked together.
- H.H.H.—Your specimens are iron pyrites found in coal; one of them is pyrites submitted to heat, and sand from drilling.
- J. F.-It would be necessary to have some of the black substance from the needle gun cartridge in order to pronounce what it is.
- W. S. B.-Itis limonite, and contains about 80 percent of oxide of iron.
- W. J. C.—The samples sent appear like good specimens of lithographic stone; but in order to determine its yalue, practically, a specimen about 12 inches long x 6 inches wide is necessary.
- T. B.G.—The mineral sent is mica slate, composed es sentially of mica and quartz. The folia of mica are sometimes so small that they are hardly discernible by the eye, as in this specimen. It can sometimes be split into tabular masses and employed for many common purposes. It is very difficult to fuse, and has been used in constructing the hearths and sides of furnaces for melting iron, etc.
- P. J. K.-An analysis of the powder revealed the presence of oxide of iron, silica, clay, carbonate of lime, chloride of potassium, chloride of sodium, and some organic matters. But it is not possible to tell with certainty, from such residues, whether or not the drinking water is injurious. The water itself must be analyzed. We should, however, in this case suspect some contamination. The mode of remedying it could only be indicated after the completer examination spoken of above.
- S. H .- Yellow calcite or carbonate of lime, of no par ticular value.
- C. H. F.-Galena, sulphide of ead.
- N. W. W .- Lenticular argillaceous oxide of fron. In this species, the oxide of iron is united by mixture or combination with clay. It ordinarily melts with ease, affording from 30 to 50 per cent of iron.
- A. S. T.-Your specimen is neither isinglass nor silica. It is gypsum, and, by burning, will yield excellent plaster of Paris.
- R. W. F .- The shining particles in the black rock are fron pyrites, and are of no value.
- J. A. D.-1. Impure limestone. 2. Sulphide of zinc,
- containing 67 per cent zinc. J. N. S.-Iron pyrites, of no value at present.

- you wish an analysis, it will cost \$10.
- R. H. W.-Theblue mineral in the rock is silicate of copper, and contains about 45 per cent of oxide of copper. The yellow is sulphide of copper, containing about 35 per cent of copper.
- W. C. C.& Co.—The material sent seems to be of the nature of Portland cement. An analysis will cost \$10. T. C. H.—The shining metallic looking substance is iron pyrites.
- S. E. G. C.-These specimens consist of indurated clay or shale, and the action on the piece of iron shown was due to the free silica forming a slag with the oxide of iron and leaving a clean metallic surface.
- R. W. F .- This is galena; but to determine the amount of silver in it, if any, will require an analysis, costing \$10. F. A. B.—This specimen is hornblende, a compound of silica, alumina, lime, magnesia, oxide of iron, and sometimes manganese.
- J.E. S .- In order to determine the value of litho graphic stone, we require a sample about 12 inches long, 6 inches wide and 2 inches thick. Your specimens look promising. Send us, if possible, a sample of the size mentioned. Lithographic stone is a fine grained limestone; and when of good quality is of a yellowish gray color and uniform throughout. It is free from veins, fibers, and spots; a steel point makes an impression on it with difficulty, and the splinters broken off by a hammer show a conchoidal fracture.
- H. L. C. asks: How can I paint tin so as to give it a fine glossy appearance? Can japanning be done withoutheat?—D. L. B. asks: How is wine made from cultivated grapes?—G. M. S. asks: What kind of paint will adhere best to articles of brass or copper? I want a bright vermillon color, and it is to be exposed to water.-W. V. asks for a recipe for plating gold without a battery.—J. F. J. G. asks: What substance is there which, combined with glycerin, will render leather perfectly waterproof?—V. E. Jr. asks: How many planofortes are annually manufactured in the United States -B. W. C. asks: How can I remove green beech and cherry stumps in the most speedy and effectual manner without digging them up? I have heard that oil of vit-riol placed in them will rot them out in a short time. Will it do it? If so, how much should be used ?-W. C. L. asks: Can any one give me a rule for setting iron axles ?-J. H. P. asks for a cure for gapes in chickens. The disease generally makes its appearance about two or three weeks after the chickens are hatched, and continues for from four to six weeks. It is supposed that the parent insect lays its eggs upon the nostrils of the chick, which soon hatch into worms and crawl down into the trackea, make their way again into the open air and burrow in the earth to undergo transformation.

COMMUNICATIONS RECEIVED.

The Editor of the SCIENTIFIC AMERICAN acknowledges, with much pleasure, the re ceipt of original papers and contributions upon the following subjects:

On the Use of Both Hands. By J. D. B.

On the Torpedo. By

On Kepler's Third Law. By G. E. W. On Cotton Planting. By W. D. H.

On Light Steam Rams. By S. S. On Two Problems. By G. W. E.

On the Attraction of the Sun and Earth, By D. E. G.

On a New System of Telegraphy. By E. E. W. B.

On Nerve Force. By I. R.

On the Pons Asinorum. By F. S.

On the Detroit Tunnel. By A. H. On the Transfusion of Blood. By X. Y. Z.

Also enquiries and answers from the follow

ing: O. G.-R. S.-F. McC.-I. M. W.-E. S.-E. N. K.-

D. P. W. Correspondents in different parts of the country ask

Who makes small oscillating steam ergines for running sewing machines? Who makes machinery formaking paper pulp from wood? Who sells revolving bolts for dressing middlings? Who builds lime kilns of the most approved pattern? Who makes a hub boring and mortise machine, to go by hand power? Who sells the best clothes mangle? Who deals in old coins? Makers of the above articles will probably promote their interests by advertising, in reply, in the Scientific American CAN.

Several correspondents request us to publish replies to their enquiries about the patentability of their in ventions, etc. Such enquiries will only be answered by letter, and the parties should give their addresses.

Correspondents who write to ask the address of certain nanufacturers, or where specified articles are to be had also those having goods for sale, or who want to find partners, should send with their communications an amount sufficient to cover the cost of publication unde the head of "Business and Personal," which is specially devoted to such enquiries.

[OFFICIAL.]

Index of Inventions

FOR WHICH

Letters Patent of the United States WERE GRANTED IN THE WEEK ENDING March 17, 1874,

AND EACH BEARING THAT DATE.

[Those marked (r) are reissued patents.]

	Air and gas, carbureting, B. Sloper	148,579

Carpentry Made Easy

The Best Work ever issued for Carpenters, Builders and Mechanics, is CARPENTRY MADE EASY. By a Practical Mechanic, who fully appreciates, from personal experience, there are many things perplexing to understand and difficult to do until fully exhisined and tested. It makes the science and art of Carpentry crear and comparatively easy.
While it is faitspensable to the learner, there are items of information worth its price to well informed Carpenters.

ters.
It treats on the science and art of Framing on a new and improved system, with specific instruction for building Fallron Frames, Barn Frames, Mill Frames, Warehouses, Church Spires, &c. Also of Bridge Building. with valuable Tables.

The following Testimonials of "Carpentry Made Easy vill traicate its value to those who may be in doubt

will traicate its value to those who may be in doubt:

Sir:—Enclosed please find five Dollars (\$5.00) for

"Carpentry Mede Easy."

Dear Sir, as I have examined the work thoroughly, I am more than pleased with it. With an experience of more than twenty-four years at carpentering, I may say it is the best work of the kind I have ever had the good fortune to meet with, as it gives more information for the amount of money, either to Master, Workman or Journeyman, the principles being so different from other works of the kind, yet so plain that any apprentice should be able to comprehend them in a short time. The Rafter and Brace Table certainly is a great saver of thought and labor.

The work should be in the hands of all apprentices, and nine-tenths of the journeymen. If it were, we would soon have good workmen, instead of half-hands and wood-butchers.

JOHN J. NICHOLSON,

JOHN J. NICHOLSON, Carpenter and Builder, Conshohoken. Pa

Another Carpenter says:

I am well pleased with Bell's Carpentry. Every Carpenter, whether old or young should have one. It is just the book for a young beginner. No young man should attempt to learn the carpentry trade without first buying "The Art and Science of Carpentry Made Easy," by William E. Beil.

Millersburg, Ohio, June 30, 1873.

FIVE DOLLARS, BY MAIL, FOST PAID.

PATENTS

publishers of the SCIENTIFIC AMERICAN have acted as solicitors of patents in the United States and foreign countries for more than three quarters of a censury. More than fifty thousand inventors have availed themselves of their services. All patents secured through this agency receive a special notice in the SCIENTIFIC AMERICAN, which frequently attracts purchasers for the patent.
Inventionsexamined, and advice as to patentability free

Patents obtained in the best manner, and with as little delayas possible. Caveats prepared from either model ordrawings,and

filed in the Patent Office at short notice.

Special examinations as to the patentability of inven-

tions made, at the Patent Office, on receipt of model or drawingand description; cost for this search and re-

Trade Marks.-The necessary papers for securing protection to manufacturers and merchants in this country and abroad are prepared at this office.

Design Patents, for protecting artists and designers of any new ornamental work, are quickly and cheaply obtained through this office.

Copyrights obtained. Foreign Patents are solicited in all countries where patent laws exist. Pamphlets, containing the cost and

full particulars, mailed on application. Canada Patents.—Canada is one of the best countries for patents. The cost depends upon the length of time

for which a patent is desired. Full particulars by mail We shall be happy to confer with inventors, examine

their models and drawings, and advise with them as to obtaining patents without consultation fee. For every kind of information pertaining to patents, at home of

THE

AND OTHER ILLUSTRATED PAPERS.

This File and Binder consists simply of stiff covers in cloth, with a flexible back, and broad heavy leather straps across the back at the top and bottom of the inside, be-tween which are stretched stout cords, for holding six or twelve months' numbers of a weekly periocical, as illustrated by the following cut:

The File is used by merely opening a paper to its cen tral fold, and slipping one side under the first vacant cord on the right, allowing the cord to rest in the center of the fold.

For the convenience of our subscribers, we have had a supply of Files constructed as above, holding fifty-two papers, and lettered "SCIENTIFIC AMERICAN" in gilt on the side.
