THE EARLY HISTORY OF WHEELED VEHICLES AND RAILWAYS

## 

Nothing, perhaps in the history of human achievement is more interesting and instructing than the opposition offered by cupidity and prejudice to those great mechanical im. provements and inventions which aro the just pride and boast of the nineteenth century. Wo boast that our age is distinguished from all other ages, a od endowed with a special wonder and glory by its material triumphs; that we have compressed the huge globe into a nsighborhood and brought all its interests within the system of a daily newsbrought all its interests within the system of a daily news-
paper; that we have caught and hatnesseil the wild forces paper; that we have caughtere that tear the arteries of the earth and heave volof Nature that tear the arteries of the earth and heave vol-
canoes; that even magnificent Nature herself has been humcanoes; that even magnificent Nature herself has been hum-
bled to toil all day at our looms and in our factories, without food, without sweat, and without weariness; and made to run on our meanest messages. Yet all this was accomplished in the face of violent opposition.
It may at first sight seeu unreasonable and ungrateful that men, while constantly striving to better their condition, should be constantly opposing those who are contributing should be constancly opposing truth, it is an hostility which
most to their success. But in trus. has its origin in the diversities of tamper, of understanding, and of interest which are found in all eocieties, and which will be found so long as the human mind continues to be drawn in opposite directions by the charm of novelty and the charm of habit. It has been the fa:e of every man who has ever attempted to enlarge the kno wled ge, or lessen the suf. ferings, or increase the comforts of his rase, to be withatcol by the most unreasonable opposition and well nigu overcome by the most bitter ridicule; and it always must bo ro. No man, not utterly destitute of all canjor ard jadem nt, will
deny but that, in somre age anterior to the dawa of history, deny but that, in somre age anterior to the dawa of history,
there were fools who opposed the introduction of the alpha there were fools who opposed the introduction of the alpha
bet and the plow with as loud complaits and as bitter in vectives as our ancestors did that of the stage coach a nd the penny post; as we in our time have opposed railroads and telegraphs, and as fools, in some age vet far in the future, will resist some new invention or some new innovation of which the world has not now the faintest conception.
The workings of this strange species of human obstinacy, an obstinacy which the accumulated experience of nineteen centuries of progress has not been able to cure, is surely deserving of the greatest consideration, as the proper result of a cause lying deep in the innermost recesses of human nature, and which, while tending to degenerate us into bigoted dotards, has saved us from becoming siallow and reckless empirics. It will be our endeavor, therefore, to relate the history of that cruel opposition, meted out so unsparingly to those wonderful inventions now never mentioned without respect and gratitude in any part of the globe.

Of all inventions, the alphabet and printing press alone excepted, those inventions which abridge distance have undoubtedly done the most for the civilization of our species; and with these we propose to begin. To improve the means of locomotion afforded to man by Nature has been the intricate problem which all nations from the earliest down have attempted to solve; but in truth, it is only within the lifetime of the past six generations that anything approaching to a polution has been arrived at. Two hundred years ago there did not exist in all England a single navigable canal, not an inch of railway (as we understand the term), not a public conveyance that would bear comparison with the most lumbering farm wagon that can now be found on the
prairies beyond the Mississippi, and not a mile of road prairies beyond the Mississippi, and not a mile of road
which the traveler of today would not consider as im paesawhich the traveler of today would not consider as im pasea-
ble. The accounts that have come down to us of the state of travel in England under the reign of "Old Rowley, the King," are indeed surprising in the extreme. It was by the highways that both travelers and goods passed from place to place, and those highways appear to have been far worse than the most ruinous roads that can no $\boldsymbol{w}$ be found outside of the sheepwalks of Australia or the jangles of South Africa. Thorsby has left us accounts of journeys made with A frica. Thorsby has left us accouats of journegs made with a guide along roads that lead "over most prodigious high
hills," "steeper than the roofs of maoy houser," of rides hills," steeper; than the rooos of maoy houser, of rides
"along the edge of precipicrs that grew to that light and steepness, and withall so exreeding parrow, that wo had not an inch of ground to set foot upon to al ght from our horses;' and of tramps over highways " full of ice aこd scow, roughe than a ploughed field, yet hard as iroc." Hagbush lane the principal bridle path from Lond on to the north of Eng. land, was worn so deep that the rider's head was beneath the level of the ground on either side, and so narrow as barely to afford passage for a single torseman. Indeed, in many parte, being once in it,to turn ba:k became utterly impossible, such was its extreme narrownese! Nor does this seem to be the exception rather thau the rule. John Marriott has
left us a humorous ballad on the "Devonshire Lane," left us a humorous ballad on the "Devonshire Lane,",
which certainly jastifies the belief that that "bit of the road " was in a condition quite as ruicous. Even on roads which the Englishmen of that day were accustomed to regard as the best, the ruts were deep, the descents precipitous, and the mud often lay so thick that all communication was cut off for months at a time, between towns sepa:ated by scarcely a score of miles.
Over such roads as these, as mey wel be supposed, the only practicable method of traveling was on fort or on horse. The rich rode: the poor walked. W'bat the later luet in comfort and speed they more than made up in cafety, for the
dangers of the road were by no means confined to its rugged-
ness. The moupted highwayman, a marauder known to this generation only from books, was to be found on every main road. The members of Parliament, the country gentlemen, and the rural merchants traveled in bands from the remote counties to the capital, armed with swords and pistols, and in hourly fear of being stopped and plundered by Turpin or
Bradshaw, Duval or Macheath, or the hundred other celeBradshaw, Duval or Macheath, or the hundred other cele brated banditti who infested the great North Road, Hounslow Heath or Shooter's Hill. Justices rode the circuits in jack boots, the bar following on foot, surrounded by numerous escort armed to the teeth. Indeed a sum of money, called "dagger money", was annually contributed by the sheriff for the purpose of providing such escort with weapons.
Such a state of affairs in our day would bs mads the fubject of "indignation meetings", "reform associations", and oud public demands for improvement. Bat with themen of Charles II's time,the case was quite the reverse; they vig orously resisted improvement ; and it was not tiil many tol bars had been violently pulled down, and some blood shed, that a good system of road repairs was established; and not till the stage coach had been made the subject of much heated discussion,and numberless grave pamphlets and petitions to Parliament for its suppression had appeared that it ceased to be looked upon as a crying evil. This latter mode of onveyance was first introduced into England in the closing dars of the Protectorate,but did notexcitemuch public interest
till the spring time of 1669, when a daring innovation was attempted. It was announced that a vehicle described as the "Flying Coach" would make the journey, "Providence permitting", from Oxford to London between sunrise and sunset. This spirited undertaking was solemnly considered a d eanctioned by the heads of the University, and appears to bave excited the same kind of interest which is excited in our diay by the opening of a new railway. The success was complete; but with the boasts of its aupporters were mingled the complaints and invactives of its enemies. Large intereits bad been unfavorably affected, and as usual many were
disposed, from stupidity and obstinacy, to clamor against the nnovation simply besuuse it was an innovation. In John Crasset's "Reasons for Suppressing the Stage Coaches", published in 1672, they are denounced as one of the greatest evils that had happened of late years to the kingdom; mis dicial to to the public, destructive to trade, and presa and men would grow careless of good horsemanship; the Thames, that had so long been the important nursery of seamen, would cease to be the chief thoroughfare from London ap to Windsor and down to Gravesend ; and saddlers and spur riers would be ruined by hundreds. It was vehemently argued that those who traveled in coaches became weary and listless when they rode a few miles and were unwilling to get on horseback, "not able to endure frost, snow, and and keep themselves clean and neat, people rode in coaches that this was ruinous to trade, "for that most gentlemen, before they rode in coaches, used to ride with swords,belts, pistols, portmanteaus, and hat cases, which in these coaches hey have little"or no occaaion for"; and that after traveling two or three journeys on horseback their "clothes were
wont to be spoiled; which done, they were forced to have new very often, and that increased the consumption of the manufactures and the employment of the manufacturers, which traveling in coaches doth no way do." Such were the cogent reasons for which our worthy forefathers de it ultimately triumphed over all opposition, and became, with its rofy gilled coachman and facetious guard, its upsets and break downs, its " outsides" and "insides," a peculiarly English institution, is familiar to all readers of English ovels for three generations back.

## The Scient.

Mr. Proctor recently aaked for a single word, whish, with out being objectionable,should convey the meaning of "man of science." Mr. Gosse has recently suggested the name "acient"-a word which receives the support of Mr. A. J Ellis, who, in the Academy for September 19, says: "I beg eave formally to introduce a scient into this heterogeneous
company (from 'an incumbent', through 'a president', to an insolvent'), and to propose that this strictly formed dissylable should take the place of the American barbaric tri syllable 'scientist'. A 'scient' would not mean ove who possesses knowledge in general' so much as one who re.
jects all but knowledge for the foundation of bypotheses jects all but knowledge for the foundation of bypotheses, already ' knows' A ' scientist', would then be an ' adherent to scients.'" It will be seen, however, from the letter of a correspondent that the word is not entirely unobjectionable, as it may be confounded with Science when it is spoken in the plural.-English Mechanic.
We suggest that our cousins call him the " sci-ist," which will be 0 . K ., used in the singular or plural.

Cause of Some Blasting Accidents.
One cause of accident in blasting, but little understood and which applies to powder as well as nitro-glycerin, is thus stated: "The blaster, not aware that he is a walking charge of eleciricity, proceeds to his work, inserting cartridge after cartridge of nitro-glycerin, until he comes to the last, which is armed with the elertric fuse. The moment his hand couches one of the naked wires, the current passes through the pr ming, and explosion follows. Let a blaster, before he
hay olfa these wires, invariably grasp some metal in moist and contact with the earth, or place both hands against the moist walls of the tunnel."

## Buying a Horse.

The following hints on examining a horse appear in The Maryland Firmer. They contain much good advice to the non-professional dealer, but fail to cover all the defects a horse may possess. But the chances are that the purchaser who gets a horse free from every defect herein enumerated will have a pretty sound animal.
Examine the eyes in the stable, then in the light; if they re in any degree defective, reject.
Examine the teeth to determine the age.
Examine the poll or crown of the head, and the withors, or top of the shoulders, as the former is the seat of poll evil, and the latter that of fistula.
Examine the front feet; and if the frog has fallen, or settled down between the heels of the shoes, and the heels are contracted, reject him; as he, if not already lame, is liable to become so at any moment.
Next observe the knees and ankles of the horse you desire o purchase, and, if cocked, you may be sure that it is the essult of the displacement of the internal organs of the foot, a consequence of neglect of the form of the foot, and injudicious shoeing.
Examine for interfering, from the ankle to the knees, and it proves that he cuts the knee, or the leg between the knee and the ankle, or the latter badly, reject.

Speedy cuta", of the knee and leg are most serious in their effects. Many trotting horses, which would be of great value were it not for this single defect, are by it rendered valueless.
Carefully examine the hoofs for cracks, as jockeys have cquired great skill in concealing cracks in the hoofs. If cracks are observable in any degree, reject. Also both ook and feel for ringbones, which are callosities on the bones of the pastern near the foot; if apparent, reject.
Examine the hind feet for the samedefects of the foot and anke that we have named in connection with the front foot. Then proceed to the hock, which is the seat of curb, and both bones and blood spavins.
The former.is a bony enlargement of the posterior and lower portion of the hock joint ; the second a bony excrescence on the lower, inner, and rather anterior portion of the hock; and the last is a soft enlargement of the synovial membrane on the inner and upper portion of the back. They are either of them sufficient reason for rejecting.
See that the horse stands with the front feet well under him, and observe both the heels of the feet and shoes to see if he "forges" or overreaches; and in case he does, and the toes of the front feet are low, the heels high, and the heels of the front shoes a good thickness, and the toes of the hind feet are of no proper length, reject him; for if he still over raches with his feet in the condition described, he is incurable. If he props out both front feet, or points them alter nately, reject.
In testing the driving qualities, take the reins while on he ground, invite the owner to get in the vehicle first, then dive yourself. Avoid the display or the use of the whip; and if he has not sufficient spirit to exhibit his best speed without it, reject. Should he drive satiefactorily without, it will then be proper to test his amiability and the extent of his training in the use of the whip.
Theroughly test his walking qualities first, as that gait is nore important in the horse of all work than great trotting speed. The value of a horse, safe for all purposes without blinds, is greatly enhanced thereby.
Purchase of the breeder of the horse if practicabie; the easons are obvious.

Mr. Le Neve Foster, an English Government Inspector of Mines, has given notice to the managers of Cornieh mines to comply with the act, and remove their vertic $u$ l ladders and put them "on the lay." Tbis is an alteration which will prove a great boon to the working miners. It is a terrible task for a man to climb up vertical ladders, someimes from 180 to 260 fathoms deep, after working, perhaps n bad air, for eight hours. The climbing of these ladders has given the miners a peculiar complaint in the lungs, un-

## 

Improved Grain Cleaner.
Samuel B. Johnson, Oswego, N. Y. -Thut invention contemplates the mprovements of grain cleaners by a novel organ'zation of elements that
elieves the grain of all dust or chaff in a speedy and effictent manner, the machine itself belng cheaper in construction and dong its work more ece omicallythan those now known to the public.

Improved Steam Trap.
Willam H. Jenkins, Philadelpha.-The object of this invention is to educe the cost and increase the rellablity and general efficlency of steam
raps of the class in which a rising and falling float 18 employed to operate he valve or valves that control the discharge of the water of condensation ssel. Thed in or received from the connected steam-heating coll pipe or through which steam is admitted, and by whillow float with a tube therefrom escapes into the chamber of the trap. The float has no other outlet save the tube. The invention further consists in a weighted valve the line of buoyancy of the fich fills the lower portion of the trap below truction of the filter through which the water, condensed in the steam. heating coll, plpe, or vessel, flows into the trap.

Improved Fence
Willam C. Banks, Como, Misg:-This invention consists in forming a
fence of rails, stakes, posts, and blocks, so that it is entirely protected
 e constructed at a very small expense.

Improved Water and Gas Meter.
Thomas M. Snank, St. Albans, W. Va.-This invention consists in novel the discharge of the fluld. The invention not only slmplifies the instrumentalities by whied the oscillation is produced, and therebygreatly lessen the liability to get out of order. but insuresperfect accuracy and uniform. ity of action in the measurement.

Improved Wheat Cleaner.
Herman Kurth, Milwauzee City, Wis.-This invention relates to improved Herman Kurth, Milwaukee City, Wis.- Thisinvention reates or other im-
means for freeing wheat of light or defective graing, cockle, or
purities. It consists in the mode of suspending and rotating the cylinder; purities. It consists in the mode of suspending and rotating the cylinder;
the application of a wiper wheel for vibrating a sleve or cleaner within the application of a wiper whel for vibrating a sleve or cleaner within
the cylinder; the sriangement of an 1nclined plate or board to convey the cylinder; the sriangement of an inclined plate or board to conves
defective whest grains, cockle, and other foretgn seed from the inner periphery of the cyllinder to a trough located above the sleve by which
they are difcharged ; and in attaching elastic blocks to the wiper wheel to they are dfscharged; and in attaching elastic blocks to the wiper wheel to
break the fall or c, weussion of the yoke, whose movement imparts vibra-
tory movement to tne sleve.

## Improved Mail Bag Holder.

Blanchard Chamb riainand Augustus G. Wright, Bellefontaine, Ohto. This invention constsis inmaking the standards which support a mallbag In two parts, one of which may be adjusted on the other to ratse or lower
it. Also in angle plates to support the rear wetghted lever horizontally on the top of the post when the matl bag is upon it. Also in a plvoted cover the work with the
the angle frons.
Improved Machine for Cleaning and Separating Grain.
Herman Kurth, Milwaukee City, Wis.- The object of this invention is to provide a machine for cleaning and separating grain from cockle and other impuritles. It consigts in a tapertng metalitc cylinder suspended
upon double acting friction wheels, and provided upon its inner pertphery upon double acting friction wheels, and provided upon its inner pertphery
with flat-bottomed cavities. Said cylinder is rotated by the friction wheels, and has two gulde rollers to keep it steady. At one end of the cylinder is a gratn receiver, consisting of a aeries of steves, whith said recelver is ex
tended through the cylinder tn the form of two chutes, one for the imputended through the cyllnder tn the form of two chutes, one for the impu-
rittes, and the other for the grain. The gratn recelver and chutes are suprittes, and the other for the grain. The grain recelver and chutes are sup-
ported upon springs, and agitated by means of eccentric barrels. Inclined ported upon springs, and agitated by means of eccentric barrels. Inclined
toward the top chute, inside the cylinder, are two adjustable sllde boards rectprocating brush which engages the inner pertphery of the cylinder andinsures the removal of all particles of dirt, chaff, etc.

## Improved Slate Roof.

William Ellis Elliott, St. Dents, Md.-This invention relates to new and improved methods of rooflig, and consists in the use of slabs of slate, instead of ordinary tlles, havtng chamfered edges and jotned together in
seams at right angles to the ridge pole, by means of a cement, and supporttag each othcr by means of grooves in their upper ende running parallel to said ridge pole. Said slabs are screwed to up and down pleces, resting
upon a fett or other waterproof sheathing, which pteces divtde the space upota ent or other waterproof sheathing, which pleces divide the space up the middie of the slabs, extending up and down the fncline of the roof and forming a ventllating passage, and the other fashioned into a trough and passing up and down the roof just beneath the seams where the slabs
join, to recetve and conduct away any leakage which may result from the breaking of the cement.

## Improved Spring Board for Vehicles.

George E. Norrts, Glen's Falls, N. Y. - The object of this invention is to George E. Norris, Glen's Falls, N. Y.-The object of this in ention is to
provlde spring board wagons with a support by whtch the board may be
readily kept level or crowned, as requtred, and therebya lighter and better readily kept level or crowned, as required, and therebya lighter and better
looktag vehtcle obtained. A spring board has central springa aad longitudinally connecting brace rods, which are adjustable thereon for setting the board.

## Improved Music Leaf Turner.

George W. Rogers, South Brooklyn, N. Y., assignor to Ida Rautenberg, New York city.- This invention conststs of a sllde for moving the swinging wires for turntng over the leaves, the sald silde betng arranged to run in a
race a little below, and partly tn front of, the lower arms of the leaf-turnrace a little below, and partly in front of, the lower arms of the eaf-turn-
ing wires It has a little tongue ristng a little higher than the arms, that ing wires it has a iltlle tongue rising a ittle higher than the arms, that
aprings behind each arm when it passes the outer end, swings the arm aprings behind ach as it moves back, and passes the axis of the arm. The slide is worked in one drrection by a foot treadle and cord, and in the other by a spring. The leaf. turning wires are ptvoced side by alde in a row parallel
with the silde face, so that whtchever way they may be turned the front With the slide face, so that whichever way they may be turned the front
wire will swing a little short of the next at the outer end. When the wire will swing a itte short of 'to spring benlud to swing the wire for-
tongue passes off the front wire, ward, it will strike agatnst the next wire, and thus be prevented from
engaging it. A notched bar is arranged alongitde of the foot treaile, to engaging it. A notched bar is arranged alongstde
engage and hold it against the spring at any point.

## Improved Watch Regulator.

Foster Keeping, New York city.-This is an attachment for regulating the balance spring in connection with the hands, In exact proportion to the
distance to which they are moved forward or backward on the dial, so as distance to which they are moved forward or backward on the dial, so as
to admit thereby the mechantcal regulating of the watches without opento admit thereby the mechantcal regulating of the watches without open-
ing the inner cap and interfertng with the interior part of the wath
mechantsm. A pinion is keyed to the set hand square, for gearing with an mechantsm. A pinion is keyed to the set hand square, for gearing with an
intermediate spur wheel at the end of a spring silde plece when the same is carrted forward, whtch wheel gears also wtth a sector-shaped wheel of the balance spring, for regulating the same by turning the hand square. When,
therefore, the sllde plece is carrted forward and the hands turned by the therefore, the silde plece causes the turntng of the gear wheel and of the sector key, the pinion causes
Wheel. The regulation of the balancespring, and thereby that of the watch,
ts effected by stmply pressing on the slide end and setting the hands in for 1s effected by atmply pressing
ward or backward direction.

## Improved Joint for Check Row Cords. L. Hawortb, London, Ohto. -The object of this inv

Lysander L. Hawortb, London, Ohio. - The object of this invention is to
provtde a joint for check row cords, used for dropping devtces in corn planters, so that the cord can be readily unhooked and passed around trees,
and be hooked arain witnout requiring the changing of the corn-planting implement, or the position of the cord across the field. There is a metallic bell-shaped sleeve with projecting hook, which fy jointed to the connecting
hook, while the sleeve is firmin closed or clinched on the loop-shaped cord end after passing the sanie around the hook. The jotnt is thus adapted to serve as atop
check cord.

Improved Valve.
Hamition D. Lockwood, Charlestown, Mass.-This valve is mainlyfor use with rubber piping, it being located in a short section of tube, over Hanged ends of whtch the rubber plpe fits. One portion of the short tube extends
into the valve box and opens upward with a flanged aperture. By pressing the upper arm of a spring toward the cap, a pin is forced inward, which the upper arm of a spring toward the cap, a pin is forced inwara, which
presses the middle part of a rubber disk down upon the flange of the hole,
andcloses the valve securely. At the same time, the end of the upper arm of the spring is caught by the spring catch, which holds the valve closed
until released by pressing back the catch, when the elastictty of the rubber disk ratsesthe ptn, and the valve is again open.

Improved Pen and Pencil Case.
Richard M. Collard, New York city. $\rightarrow$ The works of thts pen and pencil
case are so contrived that the extenston tube may be forced down by the case are so contrived that the extension tube may be forced down by the
pen slide to force the pencll back into the case when the pen is shoved out, and yet the extenston tube maybe drawn back for use all the same. There tube, so that it can be readily unfaistened when it may be required to Improved Pulp Regulator for Paper Machines.
obert Hutton, Holyose, Mass.-A box, of nearly square form, flexible waterproof daphragm. The pulp flows up in one compartment to
the flextble diaphragm, and thence over a Dartitionin to two small comthe flexible diaphragm, and thence over a Dartitionin to two small com-
partments. When the pulp is thick, it will not pass over the partition partments. When the pulp is thick, it will not pass over the partition
Bo readily, and will gatheron the daphragm and will depress it, and also a plate beneath on the fnner end of a scale beam, whtch ratses the outer end and an adjustable weight, thus operating a simple mechanism, whtch has
the eff ect of raising a valve,which allows waterto flow into and mingle with the pulp which is flowing down to the pulp reservoir. The flow of pulp is
increased to one compartment and diminished to the other, according to the direction in which a gagemoves.

Improved Turbine Water Wheel. onds of the buckets below the lower rim of the wheel. These the inner wheel turne backward and outward relatively to the direction in which the the water will balance on them, and at their outerends the chutes have or offset formed on the circle described by them, bo as to cut oft the water from behind, and at the sam
shut tightat the inner ends.

## Improved Grain Binder

James L. Skelly and Willam Skelly, Sparta. Ill.-In this invention there is a needie for passing the twine through the gavel, a clamp or loop catcher
for recelviag and holding the twine while the needle goes back, and an arm for recelving and holing the twine while the needie goes back, and an arm
for carrying the twine around the bundle. Apparatus is provided for operating this mechanism, and there are clamps for compressing and holding the bun
lmproved Boiler Feeder.
Philip T. Brownell, Elmira, N. Y.-This invention consists of a double chambered hollow cyltnder, having a slow oscillatory movement imparted
to it by any sultable connection with the operating gear of the engine. Ports in the chambers are thus alternately caused to register with ports in Ports heater, a feed ptpe to the boiller, and with a steam plpe connecting with the boller at the water level, in such manner that one of the chambers will be recelving water from the heater while the other is betng emptied
into the boller. This last is caused by the action of steam admttted through the steam plpe to the surface of the water.
Improved Book Holder.
Andrew J. Furr and Walter C. Knaus, Boonsborough, Mo.-The side pass in through ellding blocks. to pins attached to the blocks, upon which are placed colled springs by which sald fingers are held down upon the book leaves. By this construc-
tion, by moving the fingers to tion, by moving the flingers to one side, the leaves can be conventently tarned. In using the holder, bars are placed upon the bed just beneath the adjusted to the proper hight, and also farther from or nearer to the read.

## Improved Surface Blow-Uff. Robert Waugh, New Orleans, La.-This Invention co

ollow flat akimmer, with wide oneng to recetve the aiste of a kind of ild directions, suspended in the boller from recelve the surface water from is vertically adjustable. It is provided with a test cock at the top, by which the scum from the surface, and also with a blow-off cock, through which the scum will be expelled. The arrangement is such that the escape pass
flected by the rising and falling of the pipe.
mproved Pulley Block Hanger.
Ray Howland, Brooklyn, N. 3 F . - This is an improvement upon the device for whtch letters patent were granted to G.B. and C. Lewis, January 1, 1867; and It conststs of a $U$ or equivalent shaped bar, to the bottom of which the
pulley biockisattached. Upon the instdes of the upperends of the branches are jointed catches, with which adjusting screws are combined in such man ber that the hangercan be readily and firmly attached to any overheadoeam
by cactug the one on each side of the beam, and pressing the against the sides by the screws. The object ts to provide a simple and efll clent hanger for use in warehouses, by which to suspend the pulley blocksor holsting tackle temporarily over any part
quired for handing and piling packages, etc.
Machine for Applying Paris Green Compounds to Cotton
Charles H. Levy, Natchitoches, La.-Two cylindersare made of fine wire gauze. To the inner surfaces are attached longitudinal strips, to one side of each of which is attached a strip of tin, whtch thus form flanges, which,
asthe cylinders revolve, ratse the compound and allow to to fall back, so as to keep it stirred up. These cylinders are mounted on the ends of a crank

## Improved Lathe Dog.

Willam Grout, New York city, aseignor to Levl A. Fuller. - This is a car ate of fron lathes. It is composed of two jaws connected toge the pivot bolt which passes through the face plate of the lathe. The carrter is fastened to the face plate by means of screw nuts, so that it will
stand out an inch from the surface of the face plate. Notches are cut on the inner sides of these jaws to more effectually hold a square or round prece of iron. The clamp is made to hold by means of a curved ratchet and thumb nut. By means of a ratchet and screw the jaws can be

Improved Pruning Shears.
Orson P. Smith, Buford, and Andrew W. Miller, Morrisonville, Ill. - A hook-shaped cutting blade sllde on a main bar, to the uppermost end of to a brace barconnected with an extension lug near the lower end of the hook blade. A cutting blade or knife is pivoted to an intermediate point
of the lever and to the hook blade at suitable distance from the cutting part of the same. A spring serves to secure the silding part of the hook blade, for the purpose of keeping the shears in open position ready for
cutting. The hook blade is placed on the branch to be cut, and the main bar pulled down, which produces the upward motion of the knife blade limb.
Improved Bilge Water Gage.
William G. Conklin, Seattle, Wash. Ter.-This invention consists of a tube formed partly or wholly of glass with a valve in the bottom to allow
the tube to fll, and a scale on the side to show the measure of the hight the tube to fill, and a scale on the side to show the measure of the hight
of water in the tube, 未hich will be the measure of the depth of water in
thehold.

## by the stem striking the bottom, and closed by a spring.

Improved Grain Binder.
Pascal Whitney and Newell Whitney, Osage, Iowa.-This invention relates to certain improvements in grain binders. It consists in a curved
passage for the grain, formed by a slotted plane surface on one side, and spring gulde bars on the other. Down this passage moves a rake, attached to chatns passing over rag wheels, which gathers up a gavel of gratn and presses it forward to a feed which carries it under a presser foot, where it
is sewn through and through by a sewing machine device, and the sheaves afterward separated from each other by a knife.

Improved Pump for Hydraulic Press.
an, Allanta, Ga.-This invention re lates to that class of double-acting pumps which are used in connection
with hydraulic presses, and consists in placing upon the piston rod of with hydraulic presses, and consists in placing upon the piston rod of a
steam cylinder a much smaller pump piston, constructed to operate in a water cylinder with an alternating high pressure and low pressure stroket,
by reason of the smaller volumes of water on one stde of the said smal,

## Improved Rein Holder Rebraska, $\mathbf{O}$. This device is desi

Improved Rein Holder.
Albert K. Smith, Nebraska, $\mathbf{0}$.-This device is derigned to take the place of the ordinary rein ring now in use on harness hames. It consists of a frame contanntng two metal rollers held agatnst each other by spring
pressure. The objects of the invention are to prevent the twisting of the retns and their falling underneath the antmal's
commonlv attend the use of the ordinary ring.

## Improved Neck Yoke.

William A. Lloyd, Cheshire, Mass.-The.object of thisinvention is to re leve the horses from the sudden strain caused by the pole and collar contions, in an upward or downward inclined position. Spreading rods are adjustably applited to the pole end of a vehtcle. Connecting chains extend
from the ends of the rod to the extremity of the pole. The triangles formed by spreader rods and chains swing readily at both sides above and below the pole, according to the higher or lower position of the same, and
neutralize thereby the injurious and annoying jerks.

Improved Apparatus for Spreading Plasters.
Willam G. Neubauer,Long Island City, N. Y. This 18 a device for Ing plasters, consisting of a bed having adjustable hinged straps and hinged plates, which hook over a straining rod so as to tightly clamp the cloth to and another plate having apertures for ear plasters. These are secured to the bedby thumb screws andmaybe clamped down by straps. Thespread erlls a metallic bar of any desired length. When the material for the plaster
is laid upon the cloth, this spreader, heated to the proper temperature, is is lald upon the cloth, this spreader, heated to the proper temperature, is
moved over, and melta and spreads the gum evenly, leaving the margin of

Improved Spark Arrester and Consumer.
E. Roberts,Ionla, Mich. - By suitable construction, as
Thomas E. Roberts, Ionia, Mich.-By sultable construction, as the sparks between a ring and the enlarged top ofthe sma okestack, and are gulded by V partitions into spouts, through which they pass into the space between
thewalls of the smoke box and a jacket, and thence through the onter row thewalls of the smoke box and a jacket, and thence
of flues into the firebox, where they are consumed.

## Improved Folding and Extension Trestle.

Hiram K. Stevens, Providence, R. I.-This Invention consists of a pair of vertical posts with braces jointed to them at the top to fold against the
poste for packing a way, and having other braces to hold them in the ex tended position for use. The posts are made in two parts. placed a little apart and connected by cross pleces to form gutdes. In the latter exten sion posts connected by a cross beam at the top work up and down to vary
the hight of the bench. The whole forms a simple and cheap bench for the hight of the bench. The whole forms a simple and cheap bench for
plasterersand others to use for holding stagtngs instde of rooms of difer plasterersand others to use for holding atagings instde of rooms of differ
ent hights. The extension posts are fastened at any required hight by ent hights. The extension posts are fastened at any require
pins put in holes in them above the cross bars of the main posts.

Improved Oar Lock.
ma, Ala. - This invention co
George L. Stuck, Selma, its middle portion 1s connected with the oar lock through the oar, while a projection on the lattere, which fits in one of the links of the chain. By
the provision of the brtale chain, the oar is secured to the oar lock, so as the provision of the brtdle chain, the oar is secured to the oar lock, so as
to prevent it from silpptng through the same; and furthermore means to prevent it from silpptng through the same, and furthermore means
are also furnished for adjusting the oar in a longitudinal direction, so as to increase or dimintish the leverage, the awlvcled oar lock cnabling the

Improved Cutter Head
George Montgomery, Galena, Ill., Thls is a doub
George Montgomery, Galena, ill.-Thls is a double cutter head in com
bination with the eccentric journal of a revolving shaft having a radts stop. A stop is arranged symmetrically to the point of greatest eccentri city of the spindle, productng thereby the throwing out of the cutting edge to a greater distance from the axis of the shaft, whose shoulder is
carried againgt the stop. The other cutting edgels thereby thrown within the circle formed by the revolving outer edge, so as to clear the work carried with its oppostte shoulder against the stoo, produclng thereby
the eccentrictty of the other cutting edge, and the clearing of the former the eccentrictity of the other cutting edge, and the clearing of the former
The cutter head secured by washer and lock nut on the spindle, and au The cutter head is secured by washer and lock nut on the spindle, and au
tomatically reversed by the reversing of the shaft motion,forming thereby tomatically reversed by the reversing of the shat

Imloroved Means for Propelling Boats
Willam H. Holdam, Crab Orchard, Ky.-The longitudinal gutde ropes are arranged near both banks in such a manner that boats may be run in
both directions on the canal without interfering with each other. By turning a lever pawl to one side, friction pulleys are instantly applied to a gutde rope, and the boat is propelled thereby, betng detached by turning the pawl in opposite direction, so as to rotate without imparting mo
tion to the boat. A revcrsing gear of the engine admits of the ready pro tion to the boat. A revcring gear of the englneadmits of the ready pro-
pulsion of the boat on the same rope for the purpose of bscktng up in friction rollers for taking up the saging rope and gutding it in horizontal position to and from the friction rollers.

Improved Machine for Dressing Millstones. Samuel G. Johnson, William S. Terry, Robert Y. H. Terry, and Alonzo
W. Terry, Hamburg, Ark.-The standards are laterally connected by strong bars carrytng at the front a top bar. with hollow screw, whitch gutdes the
shaft of the pick bar, and controls also a coiled spring, by which the force shaft of the plek bar, and controls also a colled spring, by which the force
ts imparted to the blows of the pick bar. A curved lever is inserted is imparted to the blows of the pick bar. A curved lever is inserted loose-
is with its free end into a hole at the top of the pick bar below the spring. Its shorter rearend is provided with a small roller, on which a ratchet wheel acts, operating the front end of the lever. raising the ptck
rar, and preducing short, rapld blows of the same bs the force of the bar, and preducing short, rapid blows of the same by the force of the colled spring.

Improved Screw Propeller.
Philo M. Blatchley, Gullford, Conn.-This invention consists of detach ble blades for propeller wheels, secured to the hub by the inner end fited in a dovetail spiral groove, and keyed in the groove by a key, which
is itself secured by collars ecrewed againat the hub by a nut screwing on outer end of a shaft. By this means the blades are fastened more sefrom projections as a solld hub, and the blades may, on account of not requiring a flange by which to fasten them, be made of steel plates, of which

## Improved Scaffold.

Charles M. French and John J. McFadden, Akron, O. This is a scaffold Which comprises four slotted corner posts, connected in patrs by hortdirection through the medium of long screw shafts passtng directly ndsough the top ends of the vertical slotted parts, through the tenonen ends agatnst metallit plates at the bottom of the slots in ihe posts. The
devices above referred to constitute the means for adjusting the scaffold devices above referred to constitute the means for adjusting the scaffold Hon of the entirescind eitherin adiagonal or horizontal direction, and are attached in an adjustable manner to the corner posts.

Improved Horse Protector.
Reuben P. Lawton, Oramel, N. Y.-In this device the headplece mov be ased in place oft he check rein, and be thrown out of the way on du wch
ing it , while the body of the protector is so applied to the thills that the horse may be readily unhitched without betng hindered thereby. The tangling of the tall with thesameis possible.
Treating Animal Fats and Manufacturing Artificial Butter. Cilliam L. Churchill, Rahway, N. J., and Jacob L. Englehart, New York
city, aseignors to Churchill Dairy Company, New York clty.-This process consiets in softening, washing, and disintegrating the fat of animals for consiets in softening, wasing, and disintegranng the fat of animals for
the purpose of rendering the oleomargarin and stearin separable from
the membranous tiseues. The hashed fat ts then heated by steam for the purpose of melting the same and rendering its elements mobtle. Hot air is forced through the same while in theheating caldronfor the purpose of
effecting the thorough separation of satd oleomargartn and stearin from the useless tissues, by means of whtch the oleomargarin and stearin are eliminated from the tiseues, and left in such relative positions in the cal-
dron as to be readily separated. The ellminated pure fat 1s maintanined at dron as to be readilly separated. The eltminated pure fat is maintained at
a temperature of $110^{\circ}$ Fahrenheit fortwelve hours, after which the partia separation of the oleomargarin and stearin is accomplitshed by decanta tion, and the complete separation of the oleomargarin from the steartn Fahrenheit. For these purposes a suttable agitating and purifying apparatus is employed.

Improved Seed Planter
Improved Seed Planter.
Lawrence S. Connor, Orangeburg, S. C.-This invention relates to cer Lawrence s. Connor, orangeburg, C .- inprovements in seed planters, and consists in the pecullar construc.
tion andarrangement of an opener with reference to the furrow wheel the andarrangement of an opener with reference to the furrow wheel
the combination with theafter portion of the frame of an ajjustable cor rer, and the construction and combination of dev adjusting the feed in the bottom of the grain box.
