a scar. In like manner a severed finger may be made to grow together again, and an am with live flesh from the cheek.
In such cases mucular fibers well as skin are restored or reunited by internal growth. This may be observed also wherever a deep cut is healed. It has been found, too, that the muscular tissues which perform involuntary motions in the interior of the body possess the same power of zelf-restoration. It is this recuperative faculty which enables the cattle of Abyssinia to supply their barbarous owners with steaks without losing their lives. The hungry savage throws his ox upon the ground, makes a cross cut in the skin of the flank, lifts the skin and cuts out a chunk of beef for his dinner, replaces the skin, and drives on rejoicing, trusting to internal growth to restore the mutilated part to health and soundness.
In every wound of the skin or muscle, nerves are severed. The restoration of the functions of feeling and motion, with the progressive healing of the wound, shows that the nerves are lkewise cap of in in . The renewal of nerve connection has been watched in cases, where, as is sometimes
necessary, a section of a large nerve has been cut out. In a couple of months after the nerve is cut,a gray lump appears on one extremity of the severed nerve. Growth proceeds towards the opposite nerve end until a new connection is made, at first more slender than the original ; but by degrees the nerve elements increase in size and whiteness, until, in from four to six months, the nervous cord is fully restored This process, it is said, goes on even when two inches of nerve has been excised.

About a dozen years ago it was demonstrated that cartilage formerly supposed to be incapable of renovation, was also subject to the same laws. The cartilaginous tissue of dogs and rabbits was divided, and at the end of two months was found to be completely restored. Similarly the tendons by which muscles are attached to bones are able to reunite
when severed or torn out: a fortunate circumstance for a when severed or torn out: a fortunate circumstance for a
prominent clergyman of this city, whose tendo Achillis was prominent clergyman of this city, whose tendo Achillis was
suddenly snapped while walking along the street one day last winter, thus making his foot temporarily useless. Thanks however, to the gradual reunion of the tendon, the crippled limb will in time be restored to usefulness.
Still more remarkable is the restoration of bones, and even the development of bones in abnormal positions by the transplanting of the periosteum, the membrane surrounding bony structures and the principal agent in elaborating them Formerly, in case of a badly shattered or diseased bone, the amputation of the limb was the only resource. Now the
skillful surgeon excavates the damaged parts; and in a few months the limb, which has never lost its form, repairs its months the limb, which has never lost its form, repairs its
losses, and regains its strength. Attempts have also been losses, and regains its strength. Attempts have also been
made to graft healthy bones in place of diseased ones, but they have fallen short of perfect success. The transplanting of teeth has been more successful, and partial success has attended the reproduction of teeth by a sort of budding pro cess. In its natural development, a tooth springs from a little bay or follicle, containing an organ or germ for the pro duction of the ivory of the tooth and one for the enamel. The entire follicle taken from a puppy and grafted into the jaw of an adult dog continues its development, and a perfect tooth is the result. Doubtless the same would occur in prepared to set th one he extracts, giving the patient a choice of the whole range one he extracts,giving the
Among the curiosities of this sort of surgery, we may mention the trumpet-nosed rats with which a waggish student puzzled the naturalists of Paris. By grafting the tip of one rat's tail into the snout of another rat, he produced a nondescript creature with a trumpet-shaped proboscis, for which it had no use; yet the connection of the nerves and blood vessels was complete, and the sensibility of the part so keen as to preclude the idea of mechanical attachment. Similarly cock's combs have been furnished with teeth and spur by transplanting.

## THE RECENT REMARKABLE PROGRESS IN THE BTEEL

We are inclined to believe that very few of our readers have any idea of the immense progress which has been made in the steel industry in this section of the country during the past few months. When we state that American pig has been obtained as low as $\$ 32$ per tun, from which the rails produced included but one per cent of second quality, as against imported pig at $\$ 65$ per tun, which yielded from ten to twelve per cent of second quality rails, eighteen months
ago, we need hardly poin: out that competition, under these ago, we need hardly point out that competition, under these conditions, is out of the question, and that the foreign metal in our markets bids fair to lose whatever footing it 1nay still possess. Add to the above that, with the exception of such as rails have been imported inte old contracts, no English months, and that the importation has without doubt ceased for ever, that the Grand Trunk Railway of Canada, whose president and many of whose directors are heavy stock holders in the great Barrow plant, have found it to their in terest to order 6,500 tuns of rails from the works in Troy, $\mathbf{N}$ Y., rather than send to England, and that 120,000 tunsof ore,
from which steel can be at once produced, with anthracite from which steel can be at once produced, with anthracite
coal and without admixture of other ores, can be annually mined at the Crown Point mine in this State; and perhaps we have adduced sufficient instances to bear us out in the view that the steel production of this coantry is rapidly ad. vancing toward a point of close competition with that of Great Britain.
It is well to bear in mind that the extraorainary strides
which we have indicated have mainly taken place since the exploitation of the Crown Point mine, near Lake Champlain, in New York State, and have been aided by the consolidation of the two great iron-making establishments of Troy, formerly under the control of Messrs. Erastus Corning and John A. Griswold, into one great corporation, now known as the Albany and Rensselaer Iron and Steel Company. The ore of the mine above mentioned is of singular purity, and so well adapted for steel making that it finds a market in the heart of the Pennsylvania iron district, no less than 40,000 tuns being sent thither during the present year. The Port Henry product yields seventy per cent in the furnace, and the deposit is seemingly inexhaustable. The ore, how ever, is not capable of being smelted into steel. There is a single wall, 225 feet high by 300 feet face, of ore, while the roof is supported by pillars of ore, each containing from sixty to seventy-five thousand tuns. Upwards of $\$ 2,000,000$, we are informed, have been spent in developing these re sources.

The consolidated works above mentioned use up abjut 100,0C0 tuns of pig metal yearly, and can produce about 24,000 tuns of the same from their own furnaces. Their coal expenditure is in the neighborhood of 150,000 tuns. The melting of pig for conversiou is about 300 tuns per day, and the product of steel rails 1,100 tuns, or two and a half miles, per week, two five tun converters liter ally turning out as many ingots in weight as is accomplished in Barrow with seven converters of like size. The metal is cast in ingots weighing a tun each, and from the time it leaves the cupola it never stops until it results in a finished bloom. Hammers are abolished and rolls substi tuted, and herein lies one of the important causes of the reduced cost and improved quality of the product. The latter is, by the drawing in lieu of the pounding process, rendered far more homogeneous and far more uniform throughout; while the celerity of the operation, due to the novel machinery which has been introduced, is certainly most remarkable. Each ingot makes three rails, and the bar, which on entering the rolls is thirteen inches square, is
reduced to six inches in a single heat. The time occupied reduced to six inches in a single heat. The time occupied
by the steel in changing from the bloom to a finished rail is one minute and thirty seconds. It is impossible, within the limits of this article, to describe the tables on which the metal is lifted, or the automatic fingers which turn it to present it to the rolls, or, indeed, any of the ingenious mechanism which reduces the labor of eighteen men to that of one man and a boy, and handles the great masses as if they were feahers. This we reserve for a future time, when the pencil of he artist can aid our explanation, and when we shall be nabled to tell how ingots weighing two tuns instead of one re as deftly manipulated. The cost of making the pig is which allows the manufacturer a fair profit, comes in oom Which allows the manufacturer a fair profit, comes in com-
petition with the English production, for which $\$ 95$ is demanded on this side of the water.
The facts which we have mentioned will appear to many incomprehensible when the unsettled condition of labor in Troy for some time past is recalled. This state of affairs certainly renders the circumstances all the more remarkable, for that which has been done has been accomplished in the face of strikes, and during the prevalence of trade union in. timidation, when reliable workmen were few and far be tween. In all the great works above mentioned, not a union man is employed. Abnegation of trade societies is a rigid condition upon those hired. As a result, skilled labor has had to be manufactured
Brains and the green hands did what we have told killed labor found itself for once unable to overcome its employers as it did in Pittsburgh, and skilled labor, in the persons of the trades unions, went to the wall. Mean-
while the day laborers, the carpenters, the bakers, and who while the day laborers, the carpenters, the bakers, and who
not, collected in the great plant, have, under the direction of enterprising capital, brought forth from its furnaces a production twenty per cent greater than ever before. Still better and greater, they have been the means of demonstrat commerce, when the mechanism which represents the high. est of our inventive skill, and when the arms which protect us against our enemies, are but sources of profit to foreign hands are soon to be numbered with those for ever past. The enterprise which has so successfully developed thes coverned the labor of this great undertaking andized and governed the labor of this great undertaking, exhibit a
power not only to emancipate the country from a foreign product, but also to free labor from the despotism of the trades unions.

## CIMEX LECTULARIUS.

A correspondent, who states that he has perused with much gratification our recent article on the "Mission of the Fly," based upon Mr. Emerson's ingenious researches,sends us a pathetic epistle, in which in a few poetic, almost Milto nic, phrases he depicts dire nocturnal anguish; and then anyuse for the bedbug. There is a vein of subtle sarcasm, we fear, underlying the request of our correspondent, or else he would not have made it; for the utility of that odoriferous insect as a stimulator to the invention of new exple. tives and of patent vermin eradicators is certainly unquestioned.
Still, and seriously, the writer seems to have unwittingly wandered into that same error in which nine out of ten of
those whose motto is cui bono find themselves involved. It is an entire mistake to suppose the human race of sach overweening importance in the scheme of creation that every-
and inanimate are uncoubtedly created for some wise purpose, but that such is always to enure wo the advantage of earth's history est human utility. nothing on the globe was of than still later, the earth, though inhabited by living beings, was unfit for humanity, for the creatures which then flourished would speedily have exterminated it. Because, then, the human speedily have exterminated it. Because, then, the human
race now dwells and multiplies upon the globe, there is no race now dwells and multiplies upon the globe, there is no
reason to suppose that its enemies have utterly disappeared, reason to suppose that its enemies have utterly disappeared,
any more than there is to warrant a like supposition regard. any more than there is to warrant a like supposition regard-
ing things hof tile to any other living creature. That the ing things hoetile to any other living creature. That the
number of enemies of man is constantly decreasing is true, and that some time they may altogether disappear is not without the bounds of imagination; but it nevertheless is just as plausible to believe that the great cave bears and other gigantic brutes which peopled the earth at man's advent did not attack him a whit less fiercely than cimex does now. In fact, we have no doubt that some troglodyte in the recesses of his cavern, or lake dweller perched on his pilesupported lacustrine habitation, has wondered of what earthly use cave bears, and wolves, and hyenas, and gigantic saurians were, with as much fervor as any modern individual has vexed his brain with the same thought after a night's combat with the minute pests.
Clearly, then, the attempted destruction of ourselves by the bugs is only one link in the chain which pervades all animated nature, and therefore it is with equal plausibility that it may be asked: of what use are we to the bedbug? 88 of what use the bedbug is to us. Our correspondent who describes the effect of the ravages of cimex so graphically certainly will require no answer to the former question.
We know nothing good of the bedbug; he has never found, so far as we can learn, but two defenders: one, an insane Englishman who made a pet of him, and left, on dying, to his disgusted heirs, a room swarming at every point; the other, a Banian hospital at Surat, India, in which a ward was devoted entirely to vermin, as other wards were to vari ous kinds of animals. Forbes, in his "Oriental Memoirs," says: "The overseers of the hospital frequently hired beg. gars from the streets, for a stipulated sum, to pass a night with the fleas, lice, and bugs, on the express condition of suffering them to enjoy their feast without molestation."
It is said that bedbugs did not appear in England until after the great fire in London in 1666, and then they arrived in the wood imported from America for rebuilding the city. It is hardly necessary for us to suggest that the bedbug, being indigenous to our soil, offers a grand opportunity for the display of another great national resource at the Centen. nial. Specimens of cimicides as reared in different States, and perhaps a working model of a boarding-house bedstead, in which might be displayed the entire mode of raising the inwhich might be displayed the entire mode of raising the in-
sects, would be of deep and lasting interest to foreign visitors. The fact of Pliny mentioning the bug several hundred years earlier than the time of the English writer, however years earlier than the time of the English writer, however,
rather throws a doubt upon the assertions of the latter as to rather throws a doubt upon the assertions of the latter as to
the origin of cimex. A variety of them certainly does infest pine woods-ergo, beware of pine furnirure-and has been frequently found in the great forests of Sweden, and hence it is probable that in the pine lumber carried across the Atlantic whole colonies of the pest exister, which merely added to the stock already accumulated in Britain.
It is a curious fact that, in an old edition of the Scriptures known as Matthew's Bible. published in the middle of the last century, the passage translated in our modern version "thou shalt not be afraid of the terror by night" is rendered "thou shalt not nede be afraid of any bugs by night": a plausible translation in times when houses were so infested that two noblemen, after an attempt at rest in an inn, ' were grievously frightened the next morning and sent for a leech lest they were stricken with the plague."
Cimex, among other peculiar traits, hates horses and wages desperate war on fleas. He will not attack fowls, but wil swallows and bats. Goeze has kept himsix years without iood, and he has withstood a temperature of $5^{\circ}$ below zero, Fah., without injury. The female deposits 250 eggs at a time, which require three weeks to hatch. Against these there is practically no remedy save mercury: heat, cold, moisture, and dryness being alike destitute of effect. The insect is possessed of keen sight and of an exquisite sense of smell, by the latter of which, and not (as popularly supposed) by the sensation of heat, itis guided to its prey.
The arch enemy of the bedbug is the reducius personatus, a bug which rolls itself into a ball, covers itself with dirt, and a bug which rolls itself into a ball, covers itself with dirt, and then lies motionless in wait, pouncing on the unsuspecting
cimex the moment the latter comes within reach, and suck. cimex the moment the latter comes within reach, and suck-
ing its carcass dry. The objection to training and rearing ing its carcass dry. The objection to training and rearing
the reduvius, as a hunter of bedbugs, is that it bites the human race with much more spite than it does its natura prey.
Finally, the use of cimex lectularius-if he have any, beneficial to man-is simply to preach cleanliness; for where that is maintained, he finds no resting place.

## Robert Hardwicke, F.L.S.

Mr. Robert Hardwicke, founder and publisher of Science Gossip, a very excellent English periodical, devoted mainly to entomology, zöology, and botany, recently died of paraly sis. Mr. Hardwicke is well known on both sides of the At lantic as a zealous promoter of the cause of Science, which he has materially aided by the publication of its literature in cheap and popular form. He was an earnest advocate of the study of Nature as the greatest of dall text books; and the main object of the journal, to which he devoted his best Nature's works.
