## IMPROVED AUTOMATIC TARE FILLER

* Mr. Augus'us Haerle, of Cincinnati, Ohio, has recently (March 7, 1878) patented an improved device for 6lling water, beer, oil, and other tanks. It coneis's of cocks in the filling pipes, ard a cock in a relief or signal pipe, attached to the filling pipe and connected with a float in the tank in such manner that the float closes the cocks of the filing pipe and opens the one in the relief pipe woen the tank is full; and when the water falls a little, the float opens the filling pipe and closes the otber, and thas automatically maintains the required quantity in the tank.

pig?

Fig. 1 is a sectional elevation, taken on the line, $x$ of Fig. 2 ; and Fig. 2 is a top view. $A$ is the tank, for water, beer, or other liquid. B is the filling tabe; C, the cocks in the same for shatting off the supply when the tank is full. $D$ is the relief or signal pipe for the escape of the liquid when cocks, $C$, are closed, to relieve the feed pipe of the pressare, and to show, by the liquid ranning through it, that the tank is full. E is the cock in the relief pipe, and $H$ is the float. The cocks are connected to the float by an arm, $G$, and rod, F, which are so adjusted that cock, $E$, opens a little before cocks, C, close, so as not to shat off the escape of the liquid, and cause pressure to rise in the filling pipe, and in the reverse operation, the cocks, $C$, open a little before cock, E, closes, for the same parpose. Besides re lieving the pipe, B, from andue preseure, the escape pipe, D, shows, as above explained, when the tank is fall.

## Arican Hippoputamus Hunters.

The late Dr. Lividestone, in his " Last Journals," gives the following in teresting account:
" At tbe Loang wa of Zumbo we came to a party of hergditary h'ppopotamus hanters. called makombwé or akombroé. They follow no other occupation, but when their game is getting ecanty at one spot they remove to some other part of the Loangwa, Zsmbesi, or Sbiré, and baild temporary hats on an island, where their women caltirate patches the Hest of the animals they kill is eagerly exchanged by the more setuled people for grain. They are not stingy, and are every where welcome guests. I never heard of any frand in dealing, or that they bad been guilty of an outrage on the in dealing, or that they bad been gailty of an outrage on the
poosest; their cbief chajacteristic is their courage. Their poosest; thtir chief characteristic is their courage. Their
hanting is the bravest thing I ever saw. Each canoe is hanting is the bravest thing I ever saw. Each canoe is
manned by two men; they are long light craft, scarcely half an inch in thickoess, about eightaen inches beam, and from eighteen to twenty feet long. They are formed for speed, and shaped somewhat like our racing boats. Each man uses a broad shott paddle, and as they guide the canoe slowly down the stream to a sleeping hippopotawis not a single ripple is raised on the emooth water; they look as if holding their breath, and com municate by signs only. Asthey come near the prey, the harpooner in the bow lays down his pad die and rises slowly ap, and there he stands erect, motion less, and eager, with the long-handled weapon poised at arm's lengthabove his head, till, coming close to the beast he planges it with all his might in towards the heart. During this exciting feat he has to keep his balance exactly ing this exciting feat he has to keep his balance eractly.
His neighbor in the stern at once backs his paddle, the harpooner sits down, seizes his paddle, and backs too to escape the animal, surprised and wounded, seldom returns the at tack at this stage of the hant. The next stage, however, is sall of danger.
"The barbed blade of the harpoon is secured by a long and very strong rope wound round the handle: it is intend od to come oat of its socket, and, while the iron head is firm ly fixed in the animal's body, the rope anwinds, and the haddle floats on tho surface. The hunter next goes to the
handle and hauls on the rope till he knows that he is right
over the heast: when he feels the line suddenly slacken, he is prepared to deliver another harpoon at theinstait whenhip. po's enormous jaws appsar wi'h a ternible grant above the
water. The backing by the paddles is again repeated, bat hippo o, ten assaults the canoe, cranches it with his great jaws as easily as a pig would a bunch of asparagus, or shivers it with a kick by his hind foot. Deprived of their canoe, the gallant comrades instantly dive and swim to the shore under the water: they say that the infuriated beast looks for them on the sarface, and, being be:ow, they escape his sight. When caught by many harponns, the crams of several canoes seize the handles and drag bim bither and thither, till, weakened by loss of blood, he saccuabs.
" This hanting reqairss the greatest skill, courage, and nerve that can be conceived-double armed and threefold brass, or whatever the Æaeid says. The makombwé are certainly a magnificent race of men, hardy and activg in their habits, and well fed, as the result of their brare exploits ; every muscle is well developed, and, though not so tall as some tribes, their figares are compact and finely proportioned; being a family occapation, it hes no doubt helped in the production of fine physical development. Though all the people among whom they sojourn would like the profits they secure by the flesh and curved tasks, and no game is preserved, I have met with no competitors to them excep the wayciye of Lake Ngami and adjacent rivers.
"I have seen our dragoon officers performing fencing and managing their horses $\varepsilon \frac{d e x t e r o u s l y ~ t h a t ~ e v e r y ~ m a s c l e ~}{\text { der }}$ seemed trained to its fallest power and effiency, and perhaps had they been brought up as makombroé they might have equaled their daring and consummate skill; bat we have no sport, except, perhaps, Indian tiger shooting, requiring the courage and coolness this enterprise demands. The danger may be appreciated if one remembers that no sooner is blood shed in the water than all the crocodiles below are immediately drawn up stream by the scent, and are ready to act the part of thieves in a London crowd, o resdy to

The Solar Protnberances.
For some time past the protaberences on the sun's surface have appeared less namerous. Father Secchi states that the minimum is, however, not yet attained, and this is shown by the sudden charges in the phenomenon. On one day scarcely more than three protuberances can be foand, while on the following day they may be counted by dozens, evion the following day they may be counted by dozens, evi-
dencing the fact that the solar activity in course of diminadencing the fact that the solar activity in coarse of diminu
tion, suddenly, from some unknown cause, renewsitself. Father Secchi also notes the rectilinear form of the hydrogen eraptions, which, with a thickness of eeveral seconds, rise withou deviation to a distance of two or three minates (equal to 60 terrestrial diameters) from the sun's edge. The solar atmos phere is now so calm that the expansion, which takes place at the extremity of the incandescent columns, appears per fectly sy mmetrical on the two sides of every jet.

## A SIMPLE FLOWER VASE.

Everybody is, perhaps, aware that a very tasteful hanging basket for growing plants can be made from a wire or maz zle lined with sod or moss. A variety of wire baskets o

elegant patterns, for the sume purpose, arealso sold in hard ware stores; but these, however, lack the charm which al waysattaches to an article which is the product of one's own handiwork. About the simplest and most ingenious plan for making flower baskets and pots which has come under ou notice is that recently patented by Alfred D. Lae, of Scio Ohio. A web or plat of sod is first cut of sufficient size to form the vessel when folded in proper shape. A mold of the desirtd form being previously made of wood, the sod i wrapped about it; and then tarns of cord or wire, preferable the latter, are wound spirally about the exterior so as to con fine the sod. The ends of the wire are then tightiy secured, the mold removed, and the empty space left by the latta, flled with loam, in which the plants are imbedded. The ap pearance of the finished pot is excellently shown in the an
nexed engravirg. Any desired shefe csn be made, and the cots themselves may be ornemenied with vines and flowers planted on their outer sides. In propagating and traps planting, the pot may be set directly in the bed, when the roots of the plant will find their way through the tarf. The Jatter also holds water and alds in nourishing the plants enclosed

IMPROVED MACHINE FOR STRAIGETENING METAL BARS In the annexed eagraving is represented a new machine for straightening metal bars, which involves a novel arrange ment of rollers, which, it is claimed, enables the work to be done with less power and less straiu on the machinery than when done simultaneously in both directions by alternate

horizontal and vertical rollers. Fig. 1 is a longitudinal ection, Fig. 2 a plan, Fig. 3 a transverse section, and Fig 4 an end elevation. $A$ represents the series of borizontal rollers for bending or straightening the bars, B, vertically C represents the series of vertical rollers for bending o straightening the bars horizontally, and D represents the drawing rollers for forcing the bars between the straightening rollers. The apper horizontal rollers are adjusted, and have adjusting boses and adjusting screws for setting them for bars of different sizes, and the vertical rollers of both sides are adjustable for the same purpose. In this example, the rollers are grooved saitably for bending railroad rails, for which the machine is more especially designed; but it is also applicable for bars of any form, the grooves being shaped accordingly.
Patented through the Scientific American Patent $\Delta$ gency, Febrnary 22 1876, by Messrs. Aquila Howells, Joha K Howells, and William Garrett, of Cleveland, Ohio.

## Dye Leavea.

We do not remember ever having seen mention in the pab lic prints of the leaves from which a dye is extracted. This qualityin certain plants is an interesting one for the bote nists who occasionally sojourn with us for awhile, hanting up orchids and other epecimens of the vegetation of this locality. A study and analysis of the ments of these may be of vast worth to him who is first in the examination of the subject, and the leader in making their value known to the commercial world.
Of the leaves that are made use of by our country people is one of a claes commonly called the cbina. From it a red tint is extracted. with which thestra whats, from the vicinity of Penonome,are dyed. To all appearances it is a fixed dye, which exposure to rain and sun does not materially alter We are not acquainted with the secret of the mirture, that is, if there beany mordant employed to give it its fixitr. If it be a fixed dye, not needing a mordant to give it a perma nency and inalterability, it may prove to be of great valuein commerce and the arts; for of all the vegetable dyes thas fa known and tested, there is bat the single exception of indigo which possesses the quality of durability without the necessity of a base or mordant to make it a lasting dye the necessity of a base or mordant to make it a lasting dye
that does not fade away easily. Should this china turn out to be permanent and not readily deteriorate by the action to be permanent and not readily deteriorate by the action
of temperature and moisture, it may become a valuable acof temperature and moisture, it may become a valuable ac the making up of cotton cloths something cheaper than what it is at present.
This china is a wild plant that is found in abundance $i$ many of the mountainous districts of the Isthmus. It is a vine (bejuco) that attaches itself to tall trees, and the leaves are shed in the dry season. There is no trouble in collecting them,as the time of the year is propitious for such work. It is only left to be seen whether they be a fired dye; and if hat fact be established by a competent analysis, they may be made to take a place as one of the exportable products of the country.-Panama Star and Herald.

It is said that eggs may be preserved for six months by dipping them in linseed oil, and so placing them in a layer of sand that they do not touch.
