## the cone-berried solandu

Awong the plants suitable forindoor cultivation, those which bear berries are generally considered to be the most ornamental. Among the solanums, which are very much sought after for this purpose, the subject of our illustration is likely to become a general favorite. There are several varieties of this species in cultivation, which differ from each other in size and in form of the berries; but the conical berry of the solanum capsicas rum is somewhat of a novelty. A correspondent of the English Garden, from the pages of which we select our engraving, states that a plant of this variety, about 1 foot high and 1 foot in diameter, was recently seen profusely covered with these berries, which are, when mafusely covered with a bright orange color. It is one of a batch raised from seed sown in March. The seedlings were potted out; and about the last week in May, they were potted out; and about the last week in May, they were
planted out on a western border. Here they received planted out on a western border. Here they received
no attention, except occasional waterings until the auno attention, except occasional waterings until the au-

They soon formed new roots, having been kept in a They soon formed new roots, having been kept in a Christmas, the plant, from a portion of which the ac companying illustration was prepared, was loaded with berries, handsome both in shape and color. We have no doubt that this variety, when better known, will be generally cultivated.

## TWO BEAUTIFUL YUCCAS.

The yucca family of shrubs are all, we believe, indigThe yucca family of shrubs are all, we believe, indig-
enous to this country; and they are now being much enous to this country; and they are now being much
cultivated in Europe, and are highly valued for the cultivated in Europe, and are highly valued for the
boldness and vigorous growth of their foliage, and their boldness and vigorous growth of their foliage, and their
ornamental appearance when in blossom. There are many varieties of them, some of which we have hereto fore illustrated; but we believe that the two specimens here presented are little known to the general pablic.
The yucca Treculeana was first brought from Teras in 1850, and is much cultivated in France, whither it was firs imported by Mr. Trecul, after whom it is named. It forms a very stout stem, and the fully developed leaves are from

yUCCA TRECOLEANA.
3 to $4 \frac{1}{5}$ feet long by 2 to $2 f$ inches broad, dark green on both sides, with a hard, sharp point, and very fine regular teeth The inflorescence of this species is an exceedingly dense, many branched panicle, not much overtopping the nearl y erect upper leaves. A warm sheltered situation should be selected for it. It will be seen that this plant is one of the most remarkable of its kind as regards general appeara and the size to whichits leaves attain. The flower stem which rises up to a hight of 3 feet or more, consists of a mass of branchlets about 18 inches in length, bearing multitudes of cream-colored flowers, shining as if glazed. Our second specimen is the yucca gloriosa of Linnæus and it has well been styled the most majestic and beau. tiful of the genus. It has been known in Europe since the end of the sirteenth century; and it wes, when first found on our coast (from Florida to North Carolins found on our coast (from Florida to North Carolina) about 2 feet or rather more in hight. It is now, however, by no means uncommon to see these plants reach as high as 10 or 15 feet, in favorade situations; some times, indeed, it stands when in blossom as high as 20 feet, the blossom with its stalk attaining 6 feet. This species flowers freely in sunny situations, after it has reached a certain age; but plants from suckers are us ually some years before they flower. The trunk brauch es after flowering, and it is not unusual to see old spec imens many times branched, forming very heavy heads, which should be supported. It is very variable, though perhaps, not more so than the otbar species of the gen us, but its varieties are better known. The ordinary form or type has upwards of 100 leaves in a dense tuft 24 to 30 inches long, and 3 inches broad at the middle narrowed in luxuriant specimens gradually upwards to a narrowed in luxuriant specimens gradually upwards to a
brown sharp point,and do wnwards to $1 t$ to $1 \frac{1}{2}$ inches above the base; it is green or slightly glaucous when young, very rigid, even the outer older ones remaining erect face, concave, with longitudinal folds; margin, entire with a distinct brown line; panicle, 3 to 6 feet long, ac cording to the vigor of the plant, not downy or hairy flowers, large, among the handsomest of the genus, almost globular or goblet-shaped, when the petals are in carved; petals, oblong, narrowed into a point atthe top, from $2 \frac{1}{2}$ to 3 inches deep, the inner ones from 1 to $1 \frac{1}{6}$

## SOLANUM CAPSICASTRUM

inches broad, the outer ones narrower, and distinctly band ed, or more or less tinged, with bright red down the back or somutimes the tlowers are almost a pure white, seedings vary ing much in this respect.

## Chinese Method of Welding.

The Ironmonger says that Mr. Balestier, who went on mission to the Esst, describes the Chinese method of welding cracked ironwares by cementing them with cast iron while in a liquid state. In a cast iron pan, which Me. B. required to be welded, the operator commenced by breaking the edges of the fracture slightly with a hammer, so as to en edges of the fracture slighty with a hammer, so as the fissures, after which the fractured parts were large the fissures, after which the fractured parts were placed, and held in theirnatural positions by means of wood
on braces. The pan being ready, crucibles, made of clay on braces. The pan being ready, crucibles, made of clay,
were laid in charcoal and ignited in a small poriable sheet were laid in charcoal and ignited in a small poriable sheet
iron furnace, with bellows working horizontally. As soon as the piaces of cast iron with which the crucibles were charged were fixed, it was poured on a layer of partly charred husks of rough rice, or paddy, previously spread on a thickly doubled cloth, the object of which is to preven the sudden cooling and hardening of the liquid metal While in the liquid state, it is quickly conveyed to the frac tured part under the vessel, and forced up with a jerk into the enlarged fissures, while a paper rubber was passed over the obtruding liquid inside of the vessel, making a strong substantial, and neat operation.

## Two Bee Questlone Anewered

A couple of vexed questions about bees were recently an swered by Professor C. V. Riley, at a bee keepers' counci in Sl. Louis. The first query was: Do bees make or gather loney? The Professor says they make it. Thus does Science
proclaim that the venerable Dr. Waatt: was wrong when he

YUCCA GLORIOSA.
aseerted that the busy bee "gathers honey all the day from every opening flower." The nectar lying in flower never would become honey, says Professor Riley,no mat ter how manipulated by the hands and minds of men but it is taken up by the bees and passed through a state of semi-digestion and excretion,resulting in the manufac ture of what is called honey, yet stlll retaining in part the flevor or perfume of the flowers, by which we de termine one kind of honey from another. Professor Riley's views were corroborated by a paper read by a botanist and chemist of Louisana, describing the pro cess of change uudergone by nectar in the stomach of the bee, in order to become honey
The second question is an interesting one to fruit raisers, as it involves the mooted point of whether bees do or do not injure fruit. Professor Riley, on being ap pealed to,produced anillustrationof the order of hymen optera,stating that the mouth of the bee is the most com plicated'stracture in insectanatomy. Its construction. how ever, is the same as that of the wasp, and no one denies the the wasp is capable of destroying fruit. The Professo thought beekeepers were prejudiced against the idea o such power in the possession of a bee,but it is true. Still while being capable of injuring fruit, the bees rarely do so except in seasons of severedrought and when urged by necessity. This fact is no derogation to the usefulness of the ingect for the arercise of its power as a pollonize is of undoubted value to the orchardist, even with all its depredations upon fruit.

## NEW FORM OF FERNERY

We publish herewith an engraving showing a cross section of a new form of fern house, recently erected in Scotland by Messrs. Boyd, of Paisley. The arrange ment is so well shown in the illustration that but little description is necessary. The building here shown is of large size, 30 feet highin the center, and 60 feet long but the plan can of course be adapted to circumstances. In this case strong brick walls are carried up both sides and at one end, from which the rock work slopes irregularly down on either side, forming a miniature ravine with a water all,

he stream meandering round the crags and among the state y tree ferns. The building is covered by a glass roof, sup ported by strong iron girders, and the interior is left with out a single pillar or tie rod, leaving the space wholly to the ferns and rockwork.

Usoral Rectpes for the ghop, the Rouseholde and the Faris.

A correspondent of the Ohio Farmer gives the follow. ing method of making a simple corn marker: Take a plank 7 feet long, 16 inches wide, and $1 \frac{1}{2}$ inches thick Pin this on three blocks, 5 by 8 inches thick and 16 incbes long, putting one block at each end and one in the middle. With this length the marker is easily turned at the ends. For a tongue, get a smooth tough pole, and at the ends. For a tongue, get a smooth tough pole, and
fasten it to the center of the plank in such a way that, fasten it to the center of the plank in such a way that,
when the team is hitched up, the marker will stand level. when the team is hitched up, the marker will stand level.
Now take a lath, 1 by 2 inches thick and $10 \frac{1}{2}$ feet long. Drive a staple into the plank at each end of the marker and one in the middle. Pass the lath thrcugh one outside staple and the end just through the center staple. Fasten a chain to the outer end, and the marker is completed. The chain marks where the middle block or marker must follow thenext time across. The lath must be shifted at each end so as to keep the chain on the unmarked land. When using oit, stand on the middle of the plank and keep the tongue directly over the chain mark. If the first mark was made straight, all the rest will be so, and equally distant apart. If desired, the lath may be fastened to the middle of the piank with a bolt, so that it can be turned from side to side without lifting. Secure it in position by another bolt, passed tbrough the lath and plank, near the ends of the latter.
It has recently been found by experiment at Cornell University that, as farmers generally know, by sprouting garden seeds before sowing there is a gain of three or lour days in the time of ripening.
For plating iron, steel, brass, lead, and zinc with tin, the following has recently been proposed. Prepare a solution of perchlorideof tin by passing chlorine tbrough a concentrated solution of salt of tin. Dilute the pro
