rays, the crystalization of substances by rays of light, the however, the action of the rapid stream would infallibly promise the God of our fathers that the new country will supposed magnetizing properties of light (which he found soon deepen and increase the width of the passage, Mr. Spalnot to exist), and the effects of light upon vegetation. Dr. ding estimates that in forty years the levels of the two seas thermore, that, from the association here of welcome visitors Draper was the first to photograph Fraunhofer's lines, the first to take a portrait by daguerreotypy, the first to suggest their physical or chemical composition, the first to devise of north latitude, along the estuaries of the Ural and Volga, charts of the spectral lines of bodies, the first to explain the and to a much greater distance by ships of small burden. mechanical cause of flow of sap in plants, and that the yellow ray and not the violet produces the reduction of carbonic pected, is not exceeded by that of the Suez Canal. The acid therein, and the first to photograph the moon. No one American investigator has made more original researches, or hundreds of square miles of arid Russian steppes would be extended them over a wider field, or contributed more largely to add territory and natural resources of inestimable value, to the general progress of Science, than Dr. Draper.

In 1836, another great invention appeared in the shape of revolving fire arms, which were patented by Colonel Samuel Colt, of Hartford, Conn. These were first used in the Florida war of 1837; but it was not until the outbreak of the Mexican for the purpose of raising a fund to enable one hundred and war of 1847 that Colt erected the works in Hartford which have since assumed such immense proportions. Colt also invented a submarine battery of great power. In the next year (1837), A. A. Wells patented the process now in general use for forming the bodies of fur hats by depositing the material directly on a perforated cone revolving in connection with an exhausting fan. At about this time John Ericsson successfully applied the screw propeller to purposes of navigation in England, and immediately thereafter emigrated to this mention will be made further on. In 1839 the United States government despatched an exploring expedition to the antartic regions. No other explorations of that part of the globe have since been made, and the somewhat doubtful report of an antartic continent, brought back by the United States' vessels, has not been fully verified. During the same ing to learn, they will find their fellow craftsmen ready to year Charles Goodvear made the important invention of vulcanizing india rubber. He had already discovered a method of treating the surface of native india rubber by nitric acid, which allowed a surface of rubber to be exposed on goods, ions, any attempts on their part to inculcate them will enhitherto impracticable owing to the adhesiveness of the ma- counter a rebuff so emphasized as to leave no doubt as to its order of an inventor citizen. terial. In the course of experiments in 1839, he found that a piece of rubber, mixed with ingredients among which was sulphur, upon being accidentally brought in contact with a red hot stove, was not melted; but that in certain portions it was charred, and in other portions remained elastic, though deprived of all adhesiveness. More than sixty patents were afterwards taken out by him for improvements in treating india rubber and on articles manufactured from it. In 1839 also Erastus B. Bigelow invented his power loom for weaving ingrain carpet. This machine could easily weave from twenty-five to twenty seven yards per day, whereas the previous hand loom production never exceeded eight yards. The invention was followed later by a power loom for Brussels and tapestry carpets, one of the most ingenious pieces of mechanism ever devised. Mr. Bigelow also invented a machine for weaving coach lace, and another for weaving counterpanes, both of which are in extensive use.

Here we may close the review of a period remarkable for the number of great inventions made during its continuance. The original types then produced have since formed the foundation of thousands of modifications and improvements, and the end of making such changes seems far from being attained. Progress therefore since 1840, though rapid, is due to development of previous ideas, more perhaps than to origination of new ones.

Our next issue will contain a continued history of the more remarkable inventions and discoveries from 1840 up to the present time.

RECLAIMING THE STEPPES.

It is a well known fact that there exists in the southeastern portion of the Russian empire an immense basin, depressed below the level of the ocean. In this basin lies the Caspian Sea, and into it also flow the great rivers Ural and the shouts were deafening. Quiet was not restored until the Volga, which drain a large portion of central Russia. In ceremonies were fairly opened by the orchestra playing the the course of ages, the rivers have carried down soil and famous Centennial March, written by Richard Wagner. formed vast deposits which have encroached upon the sea, Musical critics speak highly of the .composition ; but it was contracting its dimensions and elevating its bottom in parts, generally conceded that it was not adapted for outdoor per-

The importance of the work, judging from the results exworld is none too large for its population; and to reclaim the not only to the Russian empire, but to all humanity.

FRENCH ARTISANS AT THE CENTENNIAL.

It is to be regretted that a meeting, recently held in Paris twenty French artisans to visit the Centennial, should have been made the scene of wild communistic harangues by such firebrands as Louis Blanc and Victor Hugo. The circumstance tends to put the workmen, who may be sent here with the funds obtained through such arguments, in the light of representatives of a cause which is the embodiment of demagoguery, and with which American workmen, proud as they are of our republican institutions, have no sympathy. We had a sufficiency of agitation of the communistic character men be it said that, even when partisan feeling ran highest, they turned away in contempt from the blatant incitors who prated of "blood and bayonets" and denounced the authority of law.

If the French artisans come here simply as workmen seek welcome and to instruct them. If, on the other hand, they visit us as apostles of the doctrines of Rochefort, Hugo, and Blanc, while no one will challenge their right to their opinsignification.

THE OPENING OF THE CENTENNIAL.

The simple but impressive ceremonies which marked the opening of the Centennial passed off in a way that must have satisfied the most sanguine anticipations. In the hurry of preparation some things are forgotten, and others are apt not to fall in their proper places at the specified time; but on this occasion the great machine started off with wonderful precision. The day in Philadelphia dawned wet and cloudy. During the previous twenty-four hours there had been heavy rains, and many remembered with some dismay the depressing effect of the drenching showers which fell during the opening of the Vienna Exposition. Long before the appointed hour, however, the clouds broke away and the sun burst forth, and the predictions of the "probabilities" that fair weather was at hand, to the relief of all concerned, were verified. As early as nine o'clock the gates were opened; and thousands of people surged into the grounds, flocking to the front of Memorial Hall, where every inch of space commanding a view was in a few moments occupied. By the time the ceremonies began, over one hundred thousand persons had assembled, packing an area fully half a mile in length by 250 yards in width. While the people were thronging in at one portal, the orchestra of two hundred musicians and the nine hundred singers were admitted at other entrances. Later, the invited guests began to arrive; and as the dignitaries, both national and foreign, took their places, the expectant throng vented its enthusiasm in prolonged cheering. A tempestuous burst of applause greeted the Brazilian Emperor, who, with the Empress, occupied seats on the platform ; and when the President, accompanied by his military escort and by his cabinet ministers, arrived,

tion of carbonic acid by light, the interference of chemical years to bring the Caspian to a level with the Black Sea. As, but especially to join hands in a perfect fraternity, and to surpass the old in the true glories of civilization. And furfrom all nations, there may result not alone great benefits to igable. This new Mediterranean could be traversed by large invention, manufactures, agriculture, trade, and commerce. the relation between the spectra of incandescent bodies and ships from the borders of Persia to about the fiftieth parallel but also stronger international friendships and more lasting peace.

"Thus reporting to you, Mr. President, under the laws of the government and the usage of similar occasions, in the name of the United States Centennial Commission, I present to your view the International Exhibition of 1876.

On the closing of this speech, President Grant began the reading of his address. It very briefly referred to the objects of the Exposition, and to the vast progress of the nation during the past century. At the words "I declare the International Exposition now open," the signal was given, and the national flag was run up on the great tower of the main building. The bells and steam whistles all over the city burst into a chorus of noises, with which were mingled the thunder of the saluting batteries. The orchestra, organ, and singers pealed forth the Hallelujah Chorus, and the procession of invited guests, headed by the President and Emperor, was then formed, and the march through the Main Building began.

During the morning, the two great engines had been started at intervals, and every bearing had been freshly oiled, so that no possible obstacle could exist to prevent their country, to which belongs his subsequent record, of which during the strike of 1872; and to the credit of our working formal beginning of work at the proper time. Mr. Corliss stood by his gigantic offspring, waiting the arrival of the President. As the head of the procession reached the engines, General Grant and Emperor Dom Pedro stepped forward ; and instructed by Mr. Corliss, each grasped the bright lever of a throttle valve. There was a moment's delay for the dignitaries to gather, and then, at 1.20 o'clock, Mr. Corliss waved his hand, the signal for admitting the steam to the cylinders of the gigantic machines. It was a scene to be remembered ; and perhaps for the first time in the history of mankind, two of the greatest rulers in the world obeyed the

> The Emperor, with his characteristic energy, was the quickest to move his lever, but the President was but a second behind; and as the motion was completed, the steam hissed into the great cylinders, the mighty arms of metal slowly began their movement, pulleys answered to the strain of belts, and the mechanism of the vast building started into life and activity. The Empress of Brazil meanwhile visited the Women's Pavilion, and there pulled a golden cord which set in motion the engine that drives the looms Thus ended the ceremonial part of the opening, and the people scattered themselves over the grounds and through the buildings, while throngs visited the restaurants, and literally devoured every ounce of food which had been supplied; and by four o'clock, when President Grant and the Emperor returned to the grounds and sought to dine at the principal restaurant, they found several thousand hungry American sovereigns had been there before them, and they were obliged to go elsewhere for their dinner.

> The interiors of some of the buildings, by dint of day and night work of a multitude of workmen during the past week, have been partially reduced to order; but here and there, and almost everywhere, a wilderness of packing boxes and rubbish is to be met with, and it will be some time yet before every department will be in perfect order.

> It is impossible, at the present writing, to form any adequate idea as to the variety and novelty of the exhibits. The objects are there, but they are yet to be arranged and classified; and until this is done, a description of them, and a comparison with what we are used to seeing, must be deferred.

Government Provision for Mechanics at the Centennial.

We learn that a bill has been introduced in the House of Representatives, directing the President to appoint six skilled mechanics from each Congressional district, "whose duty it will be to attend the Centennial International Exposition at Philadelphia, carefully study the arts, industries, and products there exhibited, and make full report in writing of all so that for large vessels it is no longer wholly navigable. formance, as it contained very many passages wholly in-that, in their judgment, is important and useful to the prac-As the sea diminished in size, so did the supply of watery audible except to the few hundred in the immediate vicinity tical and scientific industries of this country." It is further vapor in the adjacent atmosphere become less; and moisture of the performers. This being over, Bishop Simpson ad-provided that they shall be paid for their work "such sum failing, the land near by has gradually changed into a desert, vanced to the front of the platform and delivered a lengthy as the Secretary of the Treasury shall deem a fair compenwhich is steadily growing. To reclaim this desert and restore it to its former state of Centennial Hymn, in the last portion of which nearly the of the government. fertility is the object of a gigantic engineering project, re- whole audience joined, producing a volume of sound of indecently suggested by Mr. Spalding, an American engineer re- scribable grandeur. Hon. John Welsh, President of the sident in Europe. The plan involves the connection of the Board of Finance, then formally presented the buildings to Caspian with the Black Sea by means of a canal, which is the Centennial Commission. The cantata written for the oc-education bureau was found. Most persons will agree, howdescribed in detail on another page of this issue. It appears casion, by Sidney Lanier, was next sung. The senseless ever, that, if the enlightened people of this country do not that the surface of the Caspian is forty-eight feet lower than words of this production were happily compensated for by take the trouble to learn for themselves what there is imthat of the Black Sea. Mr. Spalding proposes to excavate the superb musical setting given them by Mr. Dudley Buck. from the Caspian a cutting, 480 feet wide, westward to such a These preliminaries concluded, the first important speech distance that at its western end it would reach a depth of 32 was made, by General Hawley, President of the Centennial feet. The surface of the earth at that point would be 16 Commission. After reviewing the inception of the project feet below the level of the Black Sea. The remainder of of an international exposition, and briefly referring to the the distance is to be traversed by a narrower channel, 160 labors of those charged with its preparation, he concluded

feet wide and 9.6 feet deep at the Black Sea end, and 16 feet as follows: "It has been the fervent hope of the Commission that, deep at its junction with the broader/cutting. This gives a fall of 6.4 feet between the two extremities of the narrower during this festival year, the people from all States and secchannel, and the total length of both cuttings is about 166 tions, of all creeds and churches, all parties and classes, miles. It is calculated that the water from the Black Sea burying all resentments, would come up together to this would flow, along the slope above mentioned, at the rate of birthplace of our liberties, to study the evidence of our reome 72 miles per hour, and that, if the channels remaineds sources; to measure the progress of a hundred years; and to British public will soon find our mode of producing copies at their original dimensions, it would take four hundred examine to our profit the wonderful products of other lands, if ar better than their old plan of lithography.

The constitutional authority to incur this expenditure will probably be found, says the Evening Post, just where the authority to establish a department of agriculture and an portant and useful in the exhibition, they do not deserve to have a paternal government do it for them.

Publishing the English Patents,

The London Patent Office is about to adopt our Patent Office system of producing copies of drawings of patents by the photo-lithographic process, in place of the large lithographic sheets which now accompany the printed specifications of all English patents. Considerable opposition to this change was made by the London patent agents; but we believe it only arose from abhorrence of change, which is the national characteristic of the Englishman. But the
