recorded rainfalls in Madras, Calcutta, and Bombay for the past 64 years, comes to the conclusion that no real connection has been established between rainfalland sun spots, and second. Assuming this last mean, M. Govi, in a recent comcoincidence. *****

THE AGRICULTURAL VALUE OF WORMS.

In 1837 Mr. Darwin, in a paper read before the British Geological Society, explained how the formation of vegetathe surface of productive land was directly due to the non-nutritious matter contained in the earth originally eaten vailed, its velocity would be only 1,619 feet per second. by the worm and rejected by it, and the accumulated deposits of large numbers of worms produced the extensive own. An abstract of his investigations appears in the XIXth Century.

and, with their tails in their burrows, collect the twigs, teorite enters further into our atmosphere, it is somewhat leaves, etc., which serve as their food. This material is heaped around the orifice of the burrow and is drawn in it has been subjected to a temperature much more than suffi-, seen. piece by piece, the leaves in time becoming macerated and cient to destroy any form of organism. decomposed, and thus rendered suitable for the worms eating. The investigations were conducted in a garden having INFLUENCE OF LIGHT ON THE ELECTRIC CONDITION OF a layer of mold 9 inches deep and a subsoil of yellow diluvial sand. The worm tubes were not easily traced in the mold, but were perfectly clear in the sand, running vertically downwards to a depth of from 3 to 6 feet. On the walls of terior vessel. The vases were filled with solution and en these burrows the black masses of excrement of the worms closed in a blackened box in which was an aperture which were plainly visible. Some tubes were entirely filled with could be closed at will, or before which colored screens could this substance, the black color of which was diffused into the adjacent soil. In about half the inhabited tubes, plant roots had entered, following their course. By extended observations the author states that the roots of annuals can only penetrate into the subsoil through channels opened out to copper became more or less strongly oxidized or covered with them by earth worms, and he observes that this penetration salts, the plate, at first positive, then became negative and must be of service to the plant, as the subsoil retains mois- kept its sign when the light was altogether suppressed. The ture longer than the surface layer of the mold.

making this vegetable mold, two worms were placed in a Polished copper in sulphate of copper became first negative glass vessel filled with sand, on the surface of which was and then strongly positive. spread a layer of fallen leaves. The worms set to work at Other metals gave the following result: Clean plate of polonce, and after about six weeks the surface of the sand was ished silver, in water, negative; lightly silvered platinum, found to be covered with a layer of mold nearly half an positive; silver covered with platinum, strongly positive; inch deep, while many leaves had been carried to a depth of tin, hegative; brass acted like oxidized copper; amalgamated three inches. Worm tubes ran in all directions through the zinc, in solution of ZnO. So₃, strongly negative; ordinary zinc, sand; some were quite fresh, others had a wall of mold an nearly neutral (hence the action of the battery is due to the eighth of an inch thick, others again were completely oxidized copper); and platinum, weakly positive. filled with mold. In short the soil of the vessel was already perfectly well prepared for the growth of plants.

only about 46 grains, it produces in four hours nearly 8 grains of excrementitious matter. On an average he finds about 34,000 worms to an acre of ground. Their combined weight is therefore over 220 pounds and they produce about 37 pounds of mold in 24 hours. Besides this, they produce long ago his probable discovery of a new metal, which he a uniform distribution of the mold, open up passages in the believes to be a fourth member of the above named group, subsoil for roots, and render the subsoil fertile.

THE INTERNATIONAL RIFLE CONTEST.

lic competition was displayed by the American and British be a mixture of columbite and ferro-ilmenite. Only 40 grains teams in their recent contest at Creedmoor. The figures of the hydrated acid of the new metal were obtained, not made not only by the American team which won, but by the losing British team, have never before been equaled. metals of the tantalum group, including this new discovery, On the first day the American score stood 1655, out of a pos- are as follows: Tantalum 176, neptunium 118, niobium 114 2, sible 1800, and the British 1629; on the second day the totals and ilmenium 104 6. Their densities are: Tantalum 10 7, were respectively 1679 and 1613, giving, for full scores, neptunium 6.5, niobium 6.5, and ilmenium 5.9. Ilmenium Americans 3334 and British 3242. The Americans beat was supposed to be obtained by the same chemist from a Canadian, and Australian teams, by 208 points.

man having 15 shots over each range. As a bullseye counts hence it is generally omitted from the list of elements.

The velocity of meteorites has been found to be between 51,200 and 512,000 feet, or say, on an average, 30 miles per To the Editor of the Scientific American:

calories, equivalent to that required to raise 6,600,000 lbs. of He states that the adult worms come to surface at night water 1.8° Fah. As the heat developed increases as the me-' quite extraordinary.

METALS IN SALINE SOLUTIONS.

Metal plates were placed by Herr Hankel, one in a porous battery cup (closed by a cork) the other in a transparent exbe placed.

With two plates of polished copper, plunged in water, the plate on which the sunlight fell was negative. The action of colored rays reached its maximum in the blue. When the action is ascribed principally to the feebly refrangible rays, In order to ascertain the precise part taken by the worm in while the dark blue or violet rays render the plate negative.

The author has also studied the action of heat on the zinccopper-water element, of which he states the electric motive Herr von Hensen finds that, although the earth worm weighs force becomes augmented, while it is enfeebled by light.

(•) The New Metals Neptunium and Davyum.

Herr H. Herrman, who for many years has been investigating the metals of the tantalum group, announced not and to which he gives the name of neptunium. The mineral, in which evidence of the existence of the metal is said to have been found, came from Haddam, Conn., and was The most accurate marksmanship ever exhibited in a pub- reputed to be tantalite, though on examination it proved to sufficient for its isolation. The atomic weights of the their own winning score of last year, over the Scotch, Irish, Swedish mineral, which he called yttro-ilmenite several years ago; but its existence, in view of the subsequent re-The ranges were as usual 800, 900, 1,000 yards, each rifle- searches by M. One Reason why the Moons of Mars were not Sooner Discovered.

Mr. George R. Cather, in recounting the reasons given by Professor Newcomb before the American Association for the Advancement of Science, at Nashville, why the satellites of Mars were not sooner discovered, makes the suggestion that these satellites are of recent origin, and says: "This may be groundless, yet it is but fair, if there could be such a probability, let its weight be ever so little or great in the solution of the question, it should be stated for what it is worth. But as a reason, it is of greater importance than at first glance may be imagined; for if it is admitted as a remotely probable reason, it suggests the profoundest problem of the age-that is, that the satellite systems of the planets have been supplied by the asteroidal belt of our planetary scheme-a theory I propounded several years ago, and which since has become a solid conviction of my mind, as careful investigation of our planetary structure has confirmed me in this opinion."

----A Tree that Rains.

The Consul of the United States of Columbia in the Department of Lereto, Peru, has recently called the attention of President Prado to a remarkable tree which exists in the forests adjoining the village of Moyobamba. This tree, known to the natives as Tamai-Caspi (rain tree), is about 58 feet in height at full growth, and the diameter of its trunk is about 39 inches. It absorbs and condenses the moisture in the atmosphere with astonishing energy, and it is said that water constantly exudes from its trunk and falls like rain from its branches. So abundant is the water supply that the soil near by is turned into a marsh. The tree gives forth most water when the rivers are dry during the summer season, and when water generally is scarce. Its cultivation is proposed throughout the arid regions of Peru.

..... Bodily Recoil.

The curious fact has recently been pointed out by Mr. J. W. Gordon, in the Journal of Anatomy and Physiology, that at every beat of the heart, the whole body is projected a small but perfectly observable distance in a direction from foot to head-that is, so that any pressure exercised by the feet would undergo a diminution, while a pressure exercised by the head would be increased. When the heart contracts a quantity of blood is propelled down the aorta, while at the same time, the whole body is caused to recoil with a velocity which bears the same ratio to the velocity of the blood as the weight of blood driven out bears to the weight of the body.

When the Birds Wake Up.

A French ornithologist has lately been investigating the question of at what hour in summer the commonest small
