## \$100,000 to \$1,200,000. A wide range of products are turned out, including agricultural machinery and implements, steam full description of the contents of the June number of the designs for the hulls of vessels, which deserve our attention, boilers and engines, turbine wheels, burial cases, household SCIENTIFIC AMERICAN Export Edition. It constitutes a His first idea is that every vessel ought to be absolutely unand other furniture, carriages, malt liquors, iron railings, splendidly illustrated history of the progress of the world in sinkable. This it is intended to accomplish by means of air bread stuffs, cut stone, oils, soap, brick, sewing machines, gray iron castings, wind engines, tin, copper, and sheet iron ware, galvanized iron, pumps, wringers, churns, etc.

# THE DECLINE OF THE WHALING INDUSTRY.

followed in the highest Arctic regions, the attainment of the addition to these are embodied descriptions and engravings Pole would be an almost immediate consequence. Both of a large number of original and useful inventions, pro- tion of the propeller unadvisable as causing the evils of vibra-North and South, whale fishermen have been the pioneers, 'cesses, etc., together with tables of current prices in New tion, racing, slip, and injury from missiles or collisions. and exploring expeditions have followed them, and it is not Vork and other valuable information. The advertising one of the least sources of regret, now that the whaling in- pages, of which there are many, contain scores of large and dustry of this country has declined to meager dimensions, elegant engravings of the best American machinery, the to lessen the amount of rolling and the liability to capsize. that these bravest of seamen will no longer open the way low price at which space can be obtained enabling manuthrough uncharted seas, or make known to civilization the facturers to make lavish displays of their products for the numerous collision bulkheads forward, and the construction remotest quarters of the globe.

and bone amounted to but \$2,639,463. This is the lowest handsomely bound in covers, and constituting the most at against torpedoes by a metallic chain slung from falling recorded total since 1829, and it is about one fourth of that tractive and fine looking scientific and industrial publica- davits by means of chains passing over suitable pulleys, and for the year 1854. In 1845, 731 vessels, aggregating 233,149 tion ever issued. This splendid periodical reaches every tons, were employed in the trade. In 1876 there were but commercial center of importance throughout the world. 172 vessels, and the total tonnage was 37,828 tons.

It will at first sight be considered remarkable that so profitable an industry should have met with a decline which is amounting to a virtual abandonment. The "History of the Whale Fishery," by Mr. Alexander Starbuck, which we find embodied in the recent report of the United States Commissioner of Fish and Fisheries, gives a large number of instances where the voyages of whaling vessels have been attended with colossal profits. The most extraordinary voyage ever made is stated to be that of the Envoy of New Bedford, which sailed in 1848. This vessel returned from a of his crew who were the last to perish. The present expedicruise and was condemned as worthless, but her owner decided to fit her up for another trip at a cost of \$8,000. The result of the voyage was a profit of \$133,450. The Pioneer rapidly as possible to Whale Point, Hudson's Bay, where a of New London, worth with her outfit \$35,800, sailed in number of Esquimaux will be engaged. It is expected that June, 1864, and returned in September, 1865, with oil and bone worth \$150,000. On the other hand, there have been tionary party starts in the spring she will be used as a whaler many enormously heavy losses, such as those accruing from until the party returns. the beleaguering of whole fleets in the ice of the Arctic regions in 1871 and 1876.

Yet when all the advantages of the whale fishery are summed up, the exploration of unknown regions, the education of a skilled and hardy race of seamen, the support of the sperm candle industry, besides the profits we have indicated, it will appear that the benefits gained were large, and that the decline of the trade may be viewed as a loss in more laws proposed in the Wadleigh bill has been postponed until ways than one. Still, when the causes which have led to next season. Indeed, all the projects for the amendment of this result are considered, it will be seen to have been inevitable. The development of the Pennsylvania coal oil resources, occurring at a time when the expense of procuring whale oil was yearly increasing, proved the most powerful of the antagonistic scarcer, and it is said shyer and more difficult to capture, so that the length of the voyage has become entirely disproportioned to the quantity of oil returned. The Government, by Fah., upon the weight, temperature, pulse, respiration and the abandonment of sperm oil in favor of coal oil for light. houses, is aiding in hastening the abandonment of the pur- i body in hot, dry air produced loss of weight to an extent suit: and in addition to all these reasons are those of the in- considerably greater than normal, amounting, on the average, creased cost of fitting out and refitting vessels and the diffi- to the rate of about forty ounces an hour. This was acculty in procuring good crews.

# TRANSMITTING POWER BY ELECTRICITY.

lishment in Paris, where a process of coppering cast iron is of urea. The sweat contained a quantity of solid matter in carried on. The source of electricity is a Gramme machine, ordinarily run by a special engine at considerable expense urea. The most important effect of the bath, however, was and trouble, as it was situated at considerable distance from the stimulation of the emunctory action of the skin. By the main motor. M. Cadiat suggested the use of two Gramme machines, one to be connected to the driving shaft passing water through them from within out. The increased of the works, and to produce a current which should set temperature and pulse rate pointed to the necessity of caumachine No. 2 in motion, and this in turn might drive the tion in the use of the bath when the circulatory system was machine which supplied current for the baths. Motive discased. power was thus transmitted over a distance about 400 feet by means of a single copper wire. The system, says M.

#### Recent Ship Designs.

Sir Edmund Thompson has recently brought out some new science, invention, and the useful arts for one month. Among tubes and cells, a principle already employed in various dethe prominent subjects discussed which will excite special grees from bulkheading into compartments up to buildinterest are the elevated railways in New York, the new in- ing double skins with dividing partitions at frequent dustry of brush making by machinery, Mr. Edison's wonder-intervals. Mr. Thompson desires to carry the principle to ful carbon telegraph and heat measurer, the novelties of its utmost limit, so that, however much damage may occur It has been often said that if whaling could profitably be the Paris Exhibition, and the new electrical gyroscope. In to a ship, those parts not absolutely destroyed ought to float and sustain the crew. He also considers the present posi-

> Further, in the case of armor plated vessels, he advocates placing the armor plating inside the air tubes or cells, so as He proposes the use of steel throughout. His plans embrace benefit of purchasers abroad. The number contains ninety- of a propeller tunnel in the storn, bringing the screw well within the shelter of the hull. It is proposed to guard raised or lowered by steam hauling engines. The same plan of davits is also proposed for raising and lowering the ship's boats. The armor plating rests on a box girder shelving carried up inside from the floor of the ship, but attached to the frame.

#### -----Figures which Seem Untruthful,

Elaborate tables of the commerce of the world recently published put down the annual imports into all ports by all nations at \$7,251,000,000. At the same time the exports from all ports of all nations are stated at \$6,448,000,000. or a deficit of \$803,000,000 less going out of all ports than is coming in at all ports.

In these tables England and Germany are put down as importing nearly \$1,000,009,000 annually more than they export. Asia exports \$100,000,000 more than she imports, and the United States export \$200,000,000 annually more than thev import.

Now the question is, Where is this deficit? Is it to be accounted for in the bills of exchange sent out to pay for imports? In this way England would needs send out bills of exchange of nearly \$1,000,000,000 more than her exports each year to meet her imports, but really the balance is the other way. England receiving still more than her difference of imports and exports in interest on money than other nations.

But if so much is shown by customs records to come into port, why not show where it comes from? If America sends England a certain amount of goods, should not our record of exports to England and England's record of imports from America tally? If there is a less exact record kept of exports because they pay no duty than of imports paying duty, then what is the value of statistics? Is America exporting two for these hundred millions more than she has credit for? Is some other nation doing the same? Will Mr. Young please overhaul these statistical facts and tell us how it is?

# The Hotchkiss Ship's Log.

-----

Lieutenant D. G. McRitchie, commanding the United States steamer Tallapoosa, has recently made a report to the Navy Department relative to two taffrail logs, respectively of English and American invention. He says, after a thorough test of the American log, invented by Captain Truman Hotchkiss, of Stratford, Conn., he finds that it cannot be fouled with gulf weed or sedge, and that the dial hands cannot be tampered with. He regards it as accurate in regiscured on board, while the rotator is alone towed in the water. This permits a smaller line to be used than ordinarily, and avoids the frequent breakage of the line and the loss of the log. The dial can be easily inspected at all times, even when changing the course of the vessel, without hauling in; there is consequently little danger of overrunning. The rotator is the only part of the log in danger of loss, and that can be replaced at triffing cost. There is no liability to having the log disabled or ruined, when crossing
