## NEW BOOKS AND PUBLICATIONS.

 Department of The InTERIOR: First An-nual Report of the U. S. Entomological Commission. With Maps and Illustrations. Washington: Governm
ing Office. 8vo. pp. 477 (292).
This volume records the first year's investigations of Messrs. Riley, Packard and Thomas, as regards the
Rocky Mountain locust, its nature and habits, its habiRocky Mountain locust, its nature and habits, its habitat, and the means that have been suggested for stay-
mg its destructive attacks upon the grain fields of the mg its destructive attacks upon the grain fields of the
West. The Commissioners have been industrious at all events, and has collected a vast amount of information. They have the.satisfaction of reporting also that by their timely arrival among the people whose crops the locusts had destroyed, and by their hopeful predic-
tions and recommendations, they were able to inspire tions and recommendations, they were able to inspire
the discouraged pioneers with new hope and confldence, and so not only stopped the abandonment of their recently conquered homes, but greatly helped to draw
westward again the tide of emigration that had been westward
stopped.
Geological Survey of New Jergex. Report on Clay Deposits, with maps. 187
Trenton. 8vo. pp. 380.
bis renort cantaine not

This report contains not only a geographical and geological survey of the clay districts of New Jersey, but
chapters on the composition, properties, and origin of the'clays, and a review of their conomical uses. As clay forms the basis of some of the great industries of New Jersey, indeed of the Union as a whole, this report has considerable industrial as well as scientific interest. The sandy clays occurin miocene strata, and the plastic clays in the lower cretaceous (lower green sand). The latter aggregate a depth of 347 feet, of which the stoneware clay bed takes 30 feet, the South Amboy fire clay
bed 20 feet, sand and kaolin 10, pipeclay 10 , Woodbed 20 feet, sand and kaolin 10, pipeciay 1 , Woodsandy clay, and potter's clay) 39 feet. In 1873 there
were taken from these deposits 265,000 tons of fire clay and 20,000 tons of potter's clay.
Annual Report of the Chief Signal Of-
fice to the Secretary of War for
the fear 1877. Washington: Govern-
ment Printing Office. 8vo., pp. 570.
Charts, 62.
The signal service now sustains 182 stations, of which 82 make full telegraphic reports three times a day. Telegraphic reports are also received from twelve Canadian and other British American stations, and mail reports from seven Canadian and one West Indian station. A
careful analysis of the daily predictions, for each district and for each month in the year 1877, shows that a trifle over 86 per cent were verified, when the predictions of the barometric pressures, temperatures, winddirections, and the character of the weather are taken
into account. The percentage of accuracy of forecast into account. The percentage of accuracy of Porecast
limited to the pre-announcement of the character of the limited to the pre-announcement of the character of the
weather to be expected in the districts, exclusive of the weather to be expected in the districts, exclusive of the
other conditions above referred to, was $90 / 2$ per cent. An extended report is given of the $t$

Railroads: Their Origin and Problems. By Charles Francis Adams, Jr. New
York: G. P. Putnam's Sons. 12mo., pp.

## 216. $\$ 1.25$.

In this volume Mr. Adams first reviews the genesis of railways, depending mainly upon contemporary ac-
counts of the opening of the pioneer railroads of this country and England, then proceeds to examine the financial, social, and industrial problems to which rail-
ways have given rise. His aim is rather to discover what these problems are than to presentany plan for their solution. Seeing that they embrace not a few of the most important conditions of modern life, as well
as the most complex, Mr. Adams wisely prefers to as the most complex, Mr. Adams wisely prefers to
watch and wait, leaving it to a better instructed future watch and wait, leaving it to a bett
Railway Service. I. Trains and Stations.
ILWAY Service. I. Trains and Stations.
II. Jaggage Car Traffic. By Marshall
M. Kirkman. Published by the Railroad
Gazette. New York. 1878. 12mo. pp.
261 and 252 . $\$ 2$.
261 and $252 . \quad \$ 2$.
In "Trains and stations"Mr. Kirkman has described the physical life of the railway, the composition and
movement of railway trains, and the laws governing the same, with an exposition of the duties of train and station men. A chapter is given to telegraph operator and repairers; one to the regulations of the Austrian railway service, and another to the management of English roads. "Baggage Car Traffic "illustrates the
customs, rules and regulations of the baggage depart ment, and the parcel traffic of railroads in this country
and in Europe.

(1) C. W. Z. as s: What are the ingredi ents, proportions, and completeprocess formanufactur-
ng carbons for electrical apparatus?
A. Fine dust of coke and coking coal is first put into a close iron mould of the shape required for the carbon, and exposed to a red heat. When cool it is taken from the moald and
soaked in thick sirup and reheated. This operation is seakea in unick sirup and reheated. This operation is
repeate

## ty and conducting power.

(2) R. W. M. asks: Can I do any electroplating with seven Jars Callaud hattery, and how? A.
Yes; see p. 209 , vol. 38 , Scientific Amrrican. For Yes; see p. 209, vol. 38, Scienturic Anrrican. For
copper plating use a bath composed of pure copper sulphate dissolved in about 5 parts of water. For gold,
dissolve in solution of 4 ounces of potassium cyanide in 1 gallon of water, half an ounce of gold (by battery) or (about $150^{\circ}$ Fah.); for silver, add to a strong aqueous solution of one ounce of silver mitrate potassium cyande dissolved in a ittle water, nntil no further precipitate forms (avoid adding excess); settle, decant the
supernatant liquid, wash the residue with water, dissupernatant liquid, wash the residue with water, dis
solve it in a small quantity of strong aqueous solution of potassium cyanide, and dilute the solution to on gallon with pure water for use. For copper use a cop per anode, for silver a silver anode, etc. Potassium cyanide is poisonous.
(3) J. W. asks: How and of what mate ial is Indian ink (in blocks or sticks) made? A. Ingether by certain glutinous vegetable juices, gum, gela in, etc. The precise nature of the cement or mucilage used by the Chinese in the manufacture of their inks ia not known. But the greater part of the ink now sold as Indian ink consists of fine lampblack and glue. Purify fine lampblack by washing it with a solution of weak solution of gelatin containing a few drops of musk essence and about hale as much ambergris;
mould and dry. Instead of gelatin the following solution may be used: seed lac, 1 oz.; borax, 14 oz.; water, pint; boil until solution is effected and make up with What chemical (insoluble in water) will dissolve glue nd not injure its tenacity? $A$. We do not know of uch a solvent.
How is the Ch
How is the Chinese cement made? A. Shellac dissolved in enough alcohol or wood spirits (wood naphtha)
to make a liquid of the consistence of molasses; or o make a liquid of the consistence of molasses; or
boil shellac, 4 parts; borax, 1 part; and a small quan tity of water until dissolved, and concentrate the solutity of
tion.
(4)
(4) J. W. asks if enameled tin vessels will resist the action of acid substances as effectually as glass or queensware. A. No; thoug
enamels resist dilute acids very well.
(5) D. T. E. asks for a recipe for making a rst class article of violet conying ink, A. For blue violet, dissolve in 300 parts of boiling water methyl violet $5 B$, Hof mann violet $3 B$, or gentiana violet $B$. For eddish violet, dissolve in a similar quantity of water nethyl-violet BR. A small quantity of sugar added to hese inks will improve the copying qualities. If the
writing when dry retains a bronzy appearance more writing when dry ret
watermust be added.
(6) J. J. B. asks: What is the best trap for rapping drains, so as to prevent the entry of sewer gas
into a dwelling house? A. Use two ordinary $S$ traps in asch pipe.
(7) W. H. K. asks: How much shrinkage
in 50 gallons kerosene oil, $1 \pi 5^{\circ}$ test, say in six months when sealed? A. The only notable shrinkage liable to occur would be through loss by evaporation or leakage; the amount of such loss will depend upon the tightness
of the package.
(8) J. F. B. asks: What is the mixture applied to fish lines to render them waterproof? A Boiled oil, 2 parts; gold size, 1 part; beat together
with a little turpentine oil if necessary; apply with a piece of flannel, and expose to the air and dry.
(9) J. M.-The specimen you send is the pupa of a cat flea. The eggs of this insect are glued to four days. The white grub calls on the floor and crawls
for about the carpet, feeding on vegetable substances. In nine or ten days it assumes the pupa form, retaining nine or ten days it assumes the pupa form, retaining
this form about four days. In nine days more it be comes a perfect flea. Scotch snuff rubbed thoroughly
into the fur of the cat issaid to be an effectual remedy. Benzine will destroy the insect the stage of specimen
(10) W. Q. writes: In your "Notes and Queries" No. 11 (August 10, 1878) Inventor wants to know the best kind of wood for sound boards. You
answer, spruce. I say if hemlock be tried it found far superior. [We are aware that hemlock an found far superior. [We are aware that hemlock an
swers admirably for sounding boards, but piano manu facturersprefer spruce.-ED.]
(11) S. W. D. writes: I have shells $1 / 8^{\prime \prime}$ in diameter, $3^{\prime \prime}$ " long, closed at one end. What powder
or mixture must they be fllled with, leaving the one end open, to produce a report as loud or louder than a per cussion cap if ignited at the open end? $I$ have tried rifle powder, giant powder and others, but cannot get the required report. Please give me the exact proportions of the explosive material. A. If the explosive is not to be confned or tamped in the shell it will be necessary to employ a small quantity of something of the ably added to flowered gunpowder, a mixture of potassium chlorate with a little sulphur, or a drop of collodion. The fulminate is prepared by adding to a hot so-
lution of 40 grains of silver in $\%$ fluid oz . of nitric acid (specific gravity $=1 \cdot 37$ ), 2 fluid ozs. of alcohol. Fumes of nitrous acid and ethyl nitrite are disengaged, and the fulminate separates on cooling, and is dried on bibulous paper in grain quantities over quicklime. To prepare the picrate add to a small quantity of water containing 13 grains of potassium hydrate, 50 grains of commercial picric acid, and after standing a short time collect and
carefully dry the yellow picrate over caustic lime carefully dry the yellow picrate over caustic lime. As
both of these bodies explode with extreme violence by both of these bodies explode with extreme violence by
heat friction or percussion it is necessary to handle them with precautionand in small quantities only.
(12) B. I. 'T. writes: I wish to know what ubstance to use in making sticky fly paper? A. Boiled paper in strong solution of alum, and then dry before applying the above.
(13) C. F. W. asks if there is any way of moving the marks left on wall paper by the scratch. ng of matches, an annoying habit of careless house
servants. A. Generally, no.
(14) J. E. N. writes: A pump was put in a ter with 10 inchesstroke, 68 feet from the top of the
well, with $11 / 4$ inch gas pipe all the way. I claim that whe pump will work easier with 1 inch discharge pipe
and 114 inch suction. Am I right? A. We think not.
Minerals, etc.-Specimens have been reeived from the following correspondents, and examined, with the results stated:
R. W. S.-It consists largely of antimony.-J. H. P. t contains alumina, lime, silica, iron, and manganese air quality. No 2 lesse. -J. L.-No. 1 (marl) is of tative analysis to determine their precise market tative analysis to determine their precise market
value. The soapstone is of little value for the purpose named.
