pays them to provide the paper for such workmen. It is years than four or eight.

THE NATIONAL OBSERVATORY.

Notwithstanding the observations of the numerous celestial phenomena which have occurred during the year about the Observatory, yet a large amount of it has been done, and the observations of the year are now being reduced. During the year the 26 inch equatorial, under the charge of Professors Hall and Holden, has been pretty constantly employed in observing satellites, nebulæ, and comets. The optical power of this instrument is very fine, and was much praised through inability to meet severe and needless demands. by the foreign astronomers who visited it during the past year, but they considered its mounting as too light, and the justice of this criticism is shown in slight tremors in right ascension, though observations show that during the last five years the sun, prove that Bessel's elements of the ring are very nearly been demonstrated, spurs the inventor on to efforts which made for a satellite to Venus.

kowa Observatory, for the determination of personal errors, six nights on an average. The different combinations of the of securing a patent out of their thoughts entirely, and in angles and the distances of the stars in the trapezium of Orion were measured first with bright wires in a dark field, and then with dark wires in a bright field, six times by each method, and an adjustment of the measurements effected by discouraged. the method of least squares. AN AMENDMENT TO DISCOURAGE INVENTION.

It is to be hoped that before final action is taken upon Mr. tage of myself and those around me. I managed to keep Wadleigh's bill for the revision of the Patent Law (Senate my position, and also to keep the work up to the mark of Bill 300), more particular and searching inquiry will be former years, in the matter of cost and amount manufac- made with regard to the probable effect of Section 11. As tured. Two years passed. The machinery was getting very it stands, this section provides that, in addition to the fees badly impaired. I knew I could not keep up the work if collected when a patent is applied for and when it is issued, the machinery was not repaired properly. I yearned for there shall be paid to the Commissioner a duty of fifty dolsome means by which I could find out the wanted informalars at the end of the first four years, and another duty of tion. closing have somewhat interfered with the regular work of much to hasten our progress as a nation, that would not of our stock raisers and farmers. have been summarily extinguished. Their inventors have found them anything but profitable during the first few years, sometimes during the entire life of the patent. It would be sheer cruelty, and as impolitic as cruel, to add to the discouragements of the inventor the risk of losing all

Indeed it is altogether too common, in the discussion of this question, to overlook the fact that the majority of inventors are poor men, and that the public, which is ready enough to laud an inventor after he has compelled recognipole of the instrument has changed but the fraction of a tion of his merits, is only too ready to give him the cold minute of arc. Some changes, however, will have to be shoulder while he is struggling against poverty and the inmade, as the heavy dome makes it difficult to revolve. The ertia of professional routine and popular ignorance. The continued observations of the ring and satellites of Saturn, assurance that a patent once granted is property, that it will which were made until the planet approached too near the insure the protection of his rights when their value has correct. Frequent observations were made of the satellites very frequently make him a benefactor to his age and of Mars, Uranus, and Neptune, and an unsuccessful search country. In multitudes of cases important improvements or radical innovations of great value are delayed because of the The thirty double stars selected by Otto Struve, of Pul. inventor's inability to command the relatively small fees already demanded at the Patent Office. To add one hundred were observed by Professor Hall, each star being observed and fifty dollars to them, as proposed, would put the hope thousands of cases would result in putting an extinguisher upon their creative labors. The country cannot afford to have its best workers so seriously hampered, so needlessly

This is not a theoretical objection. The practical effect an admitted fact that poor men do not invent, or if they do Nearly 3,500 observations have been made by Professors the public reaps small benefit from their labors. THE TUNNEL UNDER THE BRITISH CHANNEL.

The reason why the Channel Tunnel Company recently ceased their operations in St. Margaret's Bay is stated to be that, when the reports as to the soundings between Sangatte and St. Margaret's Bay were handed in by the surveyors, it was found that to cut a tunnel between those points would entail an enormous amount of work in sinking. The site in question has, therefore, been finally abandoned. The scheme now before the company provides for the sinking of a new shaft at or close to Dover.

The site on the French side at Sangatte, near Boulogne. is still looked upon as the best that could be chosen for the commencement of the tunnel. The shaft sunk there is already 70 meters in depth. with a diameter of 2 meters, and the engineers consider that when they have got 10 meters further down the horizontal cutting may be commenced.

The engineers of both countries agree that the French opening of the tunnel is the most difficult part of the undertaking, as a clayey soil has to be dealt with instead of chalk, and the incursion of water causes much trouble.

PROTECTION TO BANKS.

A correspondent suggests that an insurance society could be organized, which, for a moderate premium, could insure bank premises against burglary. It would then be the duty of trained inspectors to examine into the security of the safes and locks, and to order the adoption of the latest and strongest safeguards; and should these be broken through, the reserve fund of the insurance company would make good the loss, which would thus be equally distributed over the

Possibly an organization of this sort might be useful. It would have to be very careful in its agents, however, lest it be converted into a source of danger through the collusion of inspectors and burglars. In this, as in other cases, prevention is better than cure; it would be better, as well as cheaper, for the banks to forestall the burglars with scientific safeguards. There is no fear of time-locks and electric alarms betraying combinations.

THE HOG CHOLERA COMMISSION.

Congress having appropriated at the previous session ture, and have charge of the whole inside business, as well the owner of it, who is desirous of having such a patent \$10,000 to pay the expenses of investigating the nature and condemned and killed. But that is apart from the point at cause of the diseases prevalent among swine, the Commis-Our readers will pardon the length of the citation for its issue. It is said that there are a great many worthless patents sioner of Agriculture appointed a number of competent genreal merit. It is but one of a multitude of instances which that ought to be put out of the way; and that it can be tlemen in the States of Indiana, Illinois, Iowa, Nebraska, have come to our knowledge, of young men of inherent done most readily by levying the proposed duties. If a Kansas, Missouri, North Carolina, Virginia, and the Western force, but untrained and ignorant, who, through a new life patent has any value at all, say the advocates of this change, part of New York, who have been engaged in prosecuting of thoughtfulness and study aroused and sustained by the it will be more than worth paying for; and four years is their investigations, and have nearly all submitted extended weekly instructions and suggestions of the Scientific ample time for demonstrating the worth or worthlessness of reports, which have been carefully collated and the results AMERICAN, have developed rapidly and profitably to them- any invention. W. Voyles, of New Albany, Ind., and the suggestion that the experiment be more generally tried. ways to be measured by the ability of the inventor to pay a Dr. Salmon, of North Carolina, from whose knowledge it is heavy fee: if he can pay \$185, his invention is good; if he supposed that the results of the investigation will prove of cannot, it is bad, and should be put out of the way. Under the highest importance in throwing light on a subject which this rule there is scarcely an invention of exceptional merit, has never been fully understood, and in checking a disease perhaps not one of the great inventions which have done so whose ravages yearly destroy a large portion of the revenue

Another Adverse Trade Mark Decision.

Some time ago a bill in equity was filed by Day & Frick, soap manufacturers, of Philadelphia, against P. Walls, another extensive soap manufacturer, in which an injunction was asked to restrain the employment of certain labels and wrappers used by Walls in his soaps. These labels, it was alleged, contained language similar to that registered as a trade mark at Washington by Day & Frick. The description secured by them in designating the soaps were the words "bleacher," "bleaching," together with a device of a pair of scales and other signs, and it was claimed that the use of this trade mark by Walls was an infringement.

In behalf of Walls, his counsel, Pierce Archer, subsequently filed a demurrer to the bill, claiming that the act of Congress was ultra vires—beyond the constitutional powers which authorize Congress "to promote the progress of science and the useful arts by securing for a limited time to authors and inventors the exclusive right to their respective writings and discoveries." A trade mark, Mr. Archer held, was neither an invention nor a writing, but simply an advertisement, and as such was not within the paleof the section.

Judge Cadwalader has sustained Mr. Archer's objections. on the ground that the court has no jurisdiction to entertain conflicts over trade marks. It is probable that this case will be taken to the Supreme Court of the United States.

Manes' Revolving Furnace.

The revolving furnace recently patented by Mr. James Manes, of 1844 Fulton Avenue, Brooklyn, N. Y. (formerly of New Haven, Conn.), has been applied to the extraction of quicksilver from cinnabar, to desulphurizing ores, drying
