burning 100 minutes, the whole provision has to be renewed every seven hours, while with gas no such renewal is necessary. He finds that from May 30 to October 10 there were merely a minute or two to 15, 30, 35, and even 45 minutes.

Correspondence.

Chemistry at Columbia College, New York.

To the Editor of the Scientific American :

The Scientific American is in general conducted in a spirit of so commendable fairness that I have observed with some surprise an article in your number for January 11, referring to this institution in a tone which seemed to indicate rather a purpose to disparage than a desire to convey information. The writer says:

"At a time when the value of natural and physical science as a source of mental discipline is beginning to be acknowledged, and science itself to be respected and honored here as elsewhere, it is somewhat remarkable to see one of our oldest colleges abolish the study of chemistry in her regular Yet this is what Columbia College has really done. True, the name of chemistry still appears in her list of studies, but it is studied no longer. It is but an outward pretense, a sham, an empty name, a skeleton without flesh, a shell without contents."

Now, whatever might be the facts of the case, there can be no mistaking the animus which inspires language like this. But the fact is that the opportunities afforded to the undergraduate students of Columbia College for pursuing the study of chenustry were never, since the foundation of the institution, so ample as they are at present. We have thought it judicious, as many other colleges have done, to make the extent to which the subject of chemistry is studied dependent, in some degree, upon the option of the student; but the obligatory portion of our chemical course is larger than that of Harvard, where optional supplementary instruction is provided in several different forms; and equal to that of Yale or Williams, where no optional instruction on this subject is given. Our sophomore class attend weekly lectures in elementary general chemistry throughout the year. Deducting the time given to vacations and examinations, the academic year contains about thirty working weeks. At Harvard University the freshman class attend twenty exercises in chemistry, and this is all that the obligatory course embraces in that institution. At Yale College chemistry is studied during one term of the junior year, out of two that the year embraces; and at Williams, during one term out of three-the number of exercises per week not being stated in the catalogue.

During the senior year at Columbia a course of theoretic chemistry is open to the student, of three exercises perweek throughout the year.

As to the further strictures of the article in question, they are hardly worth attention. A writer who regards spectroscopic analysis and the mechanical properties of bodies as essential parts of elementary chemistry would do well to unsubject.

I am, sir, respectfully, etc.,

F. A. P. BARNARD, President of Columbia College. Columbia College, February 19, 1879.

Fall of a Meteor in Michigan,

To the Editor of the Scientific American:

This morning at 2 (?) I saw a most magnificent spectacle. The world (E.N.E.) was on fire. There was a pyramid of red light, 60° at the base and 30° high. It lasted 6 or 8 seconds, too long to be an electric phenomenon. Was it a meteoric stone? Where did it fall? Possibly into Lake Michigan, 70 or 80 miles away. If it was an aerolite it must have been the most magnificent one ever (?) seen.

(REV.) WM. M. RICHARDS. Princeton, Green Lake county, Wis., Jan. 28, 1879.

The phenomenon observed by our correspondent was, without doubt, the meteor which (according to the Herald, of Traverse City, Mich.) was seen passing over that region few rods of Fouch's dock, at the head of Carp Lake, seven miles northwest of Traverse City, was awake and saw the flash, and was almost immediately deafened by the report of the explosion. The next morning a large hole, 50 feet or by the great employers in Massachusetts, go far to teach out- utes, and, after 12 hours' washing the oil with milk of lime, more in diameter, was discovered in the ice about 600 feet, siders that the alleged "undue influences" exerted by corpo- to remove the acids. All the tinctures for ex-For a long distance around the surface was cracked and broken, and the ice around the hole itself, being 12 or 15 inches in thickness, had the appearance of being driven raises another nice question, not simply of propriety, but of solving ether and chloroform, like alcohol; and, combined down. The water at this spot is only 8 or 10 feet deep and the bottom of the lake is soft and muddy.

SOME NEW POINTS IN THE DIAGNOSIS AND PROGNOSIS OF TYPHOND FEVER.

60 extinctions in all on the Avenue de l'Opéra, lasting from Philadelphia, Professor I. M. Da Costa developed some very ing corporation which pays its hands by the month practiand prognosis of typhoid fever. The case under consideration was that of a sailor, who had enjoyed good health until four days before his admission to the wards, when he was credit consideration is an important one. If a pay roll comes bowels were loose and his nose bled profusely. Upon ad-10412°, his pulse 92, and his respirations 24 to the minute.

Careful physical examination of the lungs failed to find urine revealed the presence in it of granular hyaline casts and of bladder epithelium.

morning remissions and evening exacerbations in the fever process. There were a few bronchial râles in the lungs.

On the day after admission profuse epistaxis supervened, and pathognomonic rose colored spots appeared on the abdomen, which grew swollen and tympanitic. The tongue its credit with other people."—Baltimore Sun. was characteristic, dry, cracked, reddish in spots, and varnished in appearance. The case was undoubtedly one of typhoid fever.

flushed, the first sound of the heart grew very feeble, and English markets, naturally causes some unpleasant feeling the throbbing of the carotid arteries at the root of the neck among the bee keepers of the Pacific coast. A producer, was very marked.

In calling attention to these three symptoms, together with for detecting adulteration: the presence of albumen in the urine so early in the course of the disease, the lecturer was led to remark that the case ing the honey thoroughly by stirring. Then add alcohol of was a very unusual one.

the fifth day of the disease, he said that early albuminuria heavy deposit of a gummy, milky mass, will form, while was never present in typhoid fever unless the case was a very with pure honey there will be only a very slight milky apgrave one; that albumen did not as a general thing appear in 'pearance observed." the urine until the third week of the disease.

So too with regard to the alteration in the first sound of the heart, which is not usually altered until late in the course of in the season, when the air is less humid, the honey gaththe disease. "When the first sound of the heart is affected ered is white, very thick and heavy, weighing 12 to 1214 lbs. early in the course of the disease it becomes a warning."

significance. When this symptom occurred in typhoid fever, cially when it was associated with great throbbing of the air becomes more humid as the rainy season approaches, and vessels at the root of the neck. When he noticed this coin- the honey gathered is thinner, has more color and candies cidence of symptoms he was in the habit of roughly diagmaking any further examination. That the present case season, candies upon the approach of winter; and a large was without doubt one of much gravity, and that on the dealer in Cincinnati says all good honey becomes candied strength of the above portentous symptoms he should order during the winter in that climate. the amount of stimulus administered to the patient to be immediately increased. SAML. M. MILLER.

Weekly Pay Days.

derstand what he is talking about before he returns to the New England manufacturers the policy and propriety of may be judged from the circumstance that over 300 tons of substituting weekly for monthly payments of wages to em- extracted honey was produced last year in Ventura county ployes. It has been consulting some of the large manufac- alone. A large part of this crop was shipped direct to Liverturing establishments upon the subject, and from the information published we learn that in New England monthly above quoted says: payments are the rule rather than the exception. It is different with us. Of course it is necessary everywhere for the character of the shipping merchants who are transacting great corporations like railroad and steamship lines, which our business, we have an abiding faith that our product will traverse great spaces, and the employes of which are often be allowed to fairly compete in these markets with like proweeks absent from the place where the payrolls are adjusted, duct from other parts of the civilized world. We wait with to pay their hands at wider intervals than a week, but with patience the results. We have the climate, the pasturage is this exception, and excepting also domestic service and farm abundant, our bee keepers are energetic, industrious, and labor, which are usually hired and compensated by the economical men; are determined to push our products into month, nearly all other wages service in this latitude, and all the markets of the world; and we warn all men who are especially that employed in shop and factory, is paid by the engaged in the production of honey elsewhere, that if they week. This is the general rule and practice, and to it there cannot produce large quantities of the article that is firstare but few exceptions besides those noted.

ers who have tried the weekly system are not disposed to go the survival of the fittest' is a fixed fact.' back from it, but those who have not tried it see great obstacles to its introduction. They contend that weekly payabout the hour named. It is described as an immense fire ments require increased clerical force and greater working ball, which lighted up the country as bright as noonday. A capital, and that they will encourage an increase in drunken rately introduced, by means of a long funnel, 2 ozs. each of night watchman at Traverse City says that he saw it explode, ness among the hands. As the Republican truly says: "This sulphuric and nitric acid, and 1.1 lb. of stronger alcohol are and that it flew into minute pieces like star dust. The one conclusion is on the old paternal principle that the laborer carefully poured upon the surface of the petroleum. The thing that all agree upon is the explosiou. This was heard cannot safely be trusted with his hire. It is alleged to be a alcohol gradually sinks to the bottom, and when coming with equal clearness and with like effect at Mayfield, 13 great kindness in the corporation to detain his wages even into contact with the acids, heat is developed and some miles south of Traverse City, and at Williamsburg, 12 miles for a month, although when the fatal pay day comes it is effervescence takes place, but not in proportion to the quaneast. The effect was of an earthquake shock. The houses followed by a debauch. If the payweregiven oftener, would tity of the liquids.
