W. GARY.

Huntingdon, Pa., March 17, 1879.

[Remarks.—None of the experiments here mentioned by Mr. Gary are new; there is no neutral line in any such sense and erroneously alluded to in his italics.

Everybody will agree with what our correspondent says lin and the kite string; but it does not necessarily follow that Gary has discovered anything with a ten-penny nail. All he appears to have done is to revive a few time-honored experiments and trot out before the public an ancient perpetual motion delusion.]

MISS HOSMER'S MOTOR.

Miss Hosmer, who announced the discovery by herself of a magnetic perpetual motion machine before Mr. Gary, has It is well known that a bar of iron held with one end near, found out by trial that the thing will not operate, and has abandoned the field. Her application for patent in England was given up after the provisional patent was obtained.

HEINRICH GEISSLER.

The world of science has lost a distinguished follower in Dr. Heinrich Geissler, who died at Bonn on the 24th of January. He was born in the village of Igelshieb, Germany, in the year 1814. Having early in life mastered the art of glass blowing, he, after many years of wandering, settled at length permanently at Bonn, finding here constant employment in the preparation of articles requisite for scientific research—a kind of work which had peculiar attractions for him. He was a master of his art, and in his hands the treatment of glass by the blowpipe attained a perfection that had been before unknown.

He planned and manufactured apparatus of the most delicate construction and of the greatest accuracy, and for the last thirty years there has been issuing from his workshop a constant succession of the most novel and ingenious devices for the furtherance of scientific discovery. He was the inventor, among other things, of the mercury air pump, the vaporimeter, the normal thermometer, and the normal aerometer. But the apparatus with which his name is most closely identified in the popular mind is that of the "tubes" which bear his name, and which were designed for the exhibition and study of the phenomena that accompany the discharges of electricity in various gases and vapors. One of the earliest investigations of Dr. Geissler was undertaken jointly with the celebrated physicist, Plücker, in 1852. They made, at this time, a series of observations on the expansion of water, and established the maximum of density at 3.8°; this was effected by means of a very delicate contrivance, in which the expansion of the water was exactly compensated by the introduction of mercury. In 1869 Geissler and Vogelsang together, having decomposed quartz and topaz by means of a galvanic current and collected the resulting gases in a vacuum, demonstrated the presence in the cavities of these With regard to the settling of the towers. Col. Paine said iron, as it will or may change the polarity of the needle as dioxide being shown in the vacuum by the electric arc. Not long after this Geissler succeeded in changing, by the action of the electric current, ordinary phosphorus into the amor-

In very many respects the career of Dr. Geissler was similar to that of Ruhmkorff, whose death we chronicled a year work arose above the water, spikes were put in the masonry proved in one end of the iron, as it comes in contact, and it ago. Both arose to positions of honor, and to a certain degree of fame, in the scientific world, from the lower walks of life; and both gave, by means of their familiarity with scientific facts and principles, and their constructive ability, an impulse to the march of original physical investigation.

In announcing his death to the Berlin Chemical Society, the President, Dr. Hoffmann, said that Dr. Geissler could be
