James Ross was there fifty years ago.

above Boothia. According to his calculation it should now tree dies. be in lat. 72° , long. 115° , in Prince Albert Land.

OBJECTIONS TO SELF-PROPELLING FIRE ENGINES.

Owing to the practical difficulties in the working of selfpropelling fire engines and doubts as to their relative efficiency, the New York Fire Department lately called for reports from the battalion chiefs with regard to the engines in use here. An opinion was also asked from the chief of the department, Mr. Eli Bates, who states the main objections to them as follows:

"Ninety pounds of steam pressure is required to be kept on the boiler continually for the purpose of conveying them to a fire, the result of which is that the continual pressure weakens the boiler, and more repairs are required than to the boilers of horse engines. The engines and pumps are used in going to and returning from fires, thereby causing considerable wear and tear on the machinery. They cannot be conveyed to and from a fire (especially when there are snow and ice in the streets) as safely as a horse engine. The wear and tear on the running gear exceeds that of a horse engine on account of the additional weight and the sudden strain when the motion is reversed, and when there is deep snow on the ground it is not a certainty that they can reach a fire without horses. With horses attached to them and assisted by steam power in heavy wheeling they are the best. They cannot be used by the department generally (the same as horse engines), but only in companies where the officers and men have been specially trained to the handling of them, and this cannot be acquired without long experience, during which time they are liable to meet with serious accidents. I would further state that I consider them more liable to cause fires from cinders than the horse engines while going to and returning from fires, especially in localities where light and inflammable goods are hanging in front of stores or on awnings."

It would appear from the above that further invention is needed before the steam fire engine can be called a perfected

THE PROSPECTS OF TEA CULTURE.

youd doubt. That by the cultivation of a few bushes in and destroy the alburnum. garden plats a great many American families may be able to secure a small quantity of finer tea than can be had in the market, without calling in outside help and without seriously some way or other, and may not only prove injurious to their increasing domestic care and labor, is quite probable. That health, but also be a frequent cause of death. But any simit will ever pay for Americans to undertake tea growing as a ple wound made upon a healthy tree is seldom or never business is altogether another matter. No doubt mechanical found injurious, but soon heals up. improvements in the processes of tea gathering and curing may greatly diminish the cost of labor; but the same imterms with that of China, India, Japan, and other lands.

Gazette, of Calcutta, in discussing the prospects of Indian to the old tree what the disease does to the young. tea. After reviewing hopefully the immediate prospects of tea culture in India, the Gazette insists that great caution is required in the extension of the tea industry.

greatly year by year, but, alas! so is the produce. It is not in the London Spectator, wherein that clever journal mornow a case of India versus China; it is India versus China, alizes at great length over what it calls scientific credulity. Java, Japan, Ceylon, etc. It is certainly quite on the cards The occasion is an ingenious hoax perpetrated last winter by progress of science, though its direction has been changed; that in a few years the supply will exceed the demand. No an Australian newspaper and widely circulated since. The one can say that it will be so; equally can no one say that it Spectator says: will not be so. But so much we can and do say; that, with things as they are to-day, he is not a wise man who embarks ment has, of course, been republished everywhere, and it is in tea cultivation, or who extends the area he has at present, amusing to see that in many instances those who republish except all the conditions for success are pre-eminently to the it think it necessary to be cautious and repudiate total disfore. We think where these all exist tea will pay for ever belief. So many wonderful things, they say, and in especial and a day; but their existence, all combined, is quite ex- one London journal says, have turned out true that it would ceptional. To give the sum of our advice in a few words: be rash to declare this one certainly invented. There is a we would not ourselves, as things are, plant tea in any but disposition perceptible to think there may be something in the best tea climate and on any but perfectly flat land—not it, though not all that is alleged, and that as Mr. Edison has unless we could eventually look for more than 6 mds. (600 bottled sound, so Signor Rotura—an Italian name was proba-pounds troy) per acre—where the communication is not bly chosen because an Italian has made the most recent and of knowledge by scientific methods. "Scientific credulity" good, and where any difficulty does now or may hereafter successful experiments in embalming-may have bottled exist as to labor."

At this rate the prospect of any great development of tea culture in this country is not alarmingly brilliant.

THE DISEASES OF BUILDING TIMBER.

that it seems an odd thing that timber trees should be almost reaching that it causes a certain powerlessness of mind, an square at the top. It weighs from 75 to 100 tons. It cost as liable to disease as man is; but it is undoubtedly true, and inability to reject at once and decidedly anything that even the disease, in the case of trees as well as of man arises from puts on the appearance of 'science.' The incapacity to finished. It is to foot the shaft of the monument to General preventable causes. Dr. James Brown states that the prin- weigh evidence-to see, for example, that for this story Wool, to be erected at Troy, N. Y. The shaft, with the cipal diseases likely to be brought on forest trees by bad there is absolutely as yet no evidence at all, any more than base stones, will form a structure of about 75 feet high. management are: (1) bark binding, (2) lichen growth on there is evidence for the authenticity of Bulwer Lytton's the bark, (3) stag-horn tops, (4) scale, (5) premature seeding, Strange Story, that there is no witness produced, or pro-(6) dropsy, (7) ulcers, (8) wounds, and (9) stunted growth of mised, or named, nothing but an unauthenticated narrative the interior of a lead pipe can be covered with an incrusthe young wood. Now, in addition to these defects, we have |-is a phenomenon we are all well acquainted with; but tation of sulphide of lead by making a warm concentrated in the manufactured timber such matters to contend with as this sort of credulity differs in kind from that. It would solution of sulphide of potash flow through it for ten or doatiness and the excess of sap and weariness, concerning almost seem as if the advance of science had in some minds fifteen minutes. Pipes thus treated seem to be covered with which so many complaints are made.

The disease called "bark bound" is caused by the bark their confidence in the usual data for reasoning had been them from acting upon the lead.

always a symptom of disease, but may be occasioned by a bottle could hold a quart, and reasoning of any kind, even temporary derangement of the outer bark, and if observed in the reasoning necessary for arithmetic or mensuration, was time, diseases may be arrested by removing the cause before entirely useless and unmeaning. The great truth that if it has had time to become decidedly fixed in the constitution two plus two can be five, counting is nonsense, and that the of the trees affected.

than otherwise, generally become staghorn-topped when if the want of gripe became general, of human reasoning grown in a soil too dry for their healthy development. Elm, power. That is at all events a strange result of the progress oak, ash, plane, etc., generally become in the same condi- of scientific discovery, and it is all the stranger because the tion when the soil in which they are grown is too damp to maintain them in a healthy state.

of some species. In forest trees it is usually found upon the

seed till they have arrived at a considerable age and size. Generally speaking, any forest tree under forty years of age bearing much seed is not likely to arrive at a valuable size. When a young tree produces a profusion of seed there can be no doubt that it is in a state of premature decay, and we vel. Yet the former assertion, though requiring, of course,

the soil is too rich for them, or where there is an excess of roots absorb into the system of the tree an excess of juice, ing of the ground and seeing that it be not over rich.

An ulcer much resembles dropsy, but it is mostly confined to the larch and others of the coniferous tribe. Its appearance is that of a running sore upon the side of the stem. where the natural juices escape in the form of a hard resinous matter. This disease is mostly found upon young trees of this order, and is frequently occasioned by insects lodging That it is possible to grow good tea in this country is be- their eggs in the inner bark, where the young live for a time

> Wounds are often caused by the trees receiving damage on their stems by having the bark peeled off by accident in

The stunted growth of young wood is at once apparent by the very short annual growth of young wood upon all the provements can be introduced elsewhere, and ultimately the lateral branches, and may be in general the natural result of it would be to blame civilization for the unreasonable beliefs American tea industry would have to compete on unequal any of the diseases already described. Every tree, when it with regard to the powers of civilized men current among has attained its full size and development of its nature, how-The question of future competition among existing tea ever healthy it may have hitherto been, gradually begins to in either case that makes the false idea tenable. growing countries is seriously considered by the Indian Tea fail in making young wood. This is the work of time, doing

"SCIENTIFIC CREDULITY."

A striking illustration of the anti-scientific bias which pre-Doubtless the tea drinkers in the world are increasing vails in certain spheres of culture is afforded in an article

> "The story having appeared in the Times without comlife; that as sound may be re-echoed weeks after it was first tific. heard, so a lamb may skip about after it has been some weeks frozen. As there is an electric telegraph why should

magnetic pole in the atmosphere above that region when Sir being girded or bound about the wood of the tree, thereby gradually so upset that they did not trust them any longer, preventing the proper flow of the sap, and also arresting the and did not see why, a far off locality being granted, parallel Further evidence as to the existence of the alleged magnetic descent of woody matter between the wood and bark. If lines should not meet, or the whole be smaller than the part. belts above the earth's surface is promised. Meantime it the cause of this disease be not remedied in time, the vital That would not, they think, be much more surprising than is of the first importance, Mr. Jenkins thinks, that it should fluids become gradually checked, till at length the passages the phonograph. We observed only a little while ago a be clearly settled whether the magnetic pole remains in or become entirely closed, and, as a natural consequence, the statement going the rounds of the newspapers that a certain Texan had eaten his own weight in meat at one sitting, no The appearance of lichens on the bark of trees is not one apparently perceiving that if that were true then a pint terms of any conceivable sum in arithmetic would all shift, Willows and poplars, which luxuriate in a soil rather damp seems to have lost some of its hold, to the indefinite injury, new credulity is almost confined to the action of 'science' itself. People are not generally more credulous. They do "Scale" is a small white insect found clinging to the bark not believe in each other more than they did, or in unusual events more than they did, and they believe in the superash while in a young state. These insects appear like very natural a great deal less than they did. If the Archbishop numerous small white spots, like those on the bark of the of Canterbury and Lord Houghton and Professor Tyndall all declared that they saw and spoke with a sentient being As to premature seed-bearing, it may be said that trees in possessing a body clearly not human, all journalists would a healthy, rapid growing state are seldom found to produce at once accuse them either of falsehood or hoaxing or a very suspicious condition of brain and eyesight; but if they all declared they had seen a man swallow a drug which turned him all over both yellow and blue at the same time, the statement would be printed everywhere as the last 'medical marmay be assured that it will not become valuable as timber. unusually complete evidence, would involve no greater im-Dropsy generally takes place in forest trees either where possibility than the existence of any supernatural being does -which existence half the incredulous accept-while the moisture about the roots. The cause appears to be that the latter is a contradiction in terms, and no more capable of proof than the assertion that on one occasion and in the which the leaves and bark cannot assimilate. In this disease usual conditions of the world, water being still water did unnatural swellings are observed on some part of the stem, outweigh mercury, which was nevertheless still mercury. and which begin to rot and throw off the bark. It is incur | There is the greatest reluctance even to consider any stateable, and the only thing to do is to prevent it by proper drain- i ment involving an acceptance of the supernatural combined with the most childlike readiness to swallow anything which can be described as a mechanical, medical, or mental marvel."

The Spectator goes on, at greater length than we have space for, to illustrate the various phases of this "new form of credulity," which is indirectly charged to the progress of science. Science has done so much that its disciples are half inclined to believe it can do anything, the Spectator would have us think. But this credulity as to the power of science is very far from being the state of mind which prevails among the scientifically minded. Over credulousness as to the possibilities of science is the weakness of those who know least of the real character of scientific achievements. In other words, credulity is a condition of ignorance and the lack of rational culture. And the success of scientific hoaxes, so-called, only measures the wide and varied unacquaintance with scientific truths among reputedly intel ligent people. To blame science for this is about as absurd as certain savages. It is the absence of civilization or science

The circumstance that many who are very skeptical with regard to alleged supernatural occurrences unsupported by sufficient evidence, are yet over-ready to accept scientific marvels, simply proves that their education is not half completed. They know too little of science, and have had no real training in scientific habits of thought. The Spectator says that men are as credulous now as ever; that the popular appetite for the marvelous has not been diminished by the so that men now look to scientific instead of supernatural agencies for its gratification.

"The process of god making, so often repeated by humanity, is going on again, and Nature is being endowed with attributes which imply an absence of conditions and enveloped in the very atmosphere of awe which once surrounded the supernatural," which is true only so far as men have not yet been brought directly under the influence of scientific culture. Just so far as men are ready to accept without evidence any assertion made in the name of science we may be sure that they are ignorant of the first great lesson that science has to teach, and that their minds have of knowledge by scientific methods. "Scientific credulity is a contradiction in terms. Credulity is essentially unscien-
