

Scientific American.

ESTABLISHED 1845.

MUNN & CO., Editors and Proprietors.

PUBLISHED WEEKLY AT NO. 37 PARK ROW, NEW YORK.

O. D. MUNN. A. E. BEACH.

TERMS FOR THE SCIENTIFIC AMERICAN.

One copy, one year, postage included... \$3 20
One copy, six months, postage included... 1 60
Clubs.—One extra copy of THE SCIENTIFIC AMERICAN will be supplied gratis for every club of five subscribers at \$3.20 each; additional copies at same proportionate rate. Postage prepaid.

The Scientific American Supplement

is a distinct paper from the SCIENTIFIC AMERICAN. THE SUPPLEMENT is issued weekly. Every number contains 16 octavo pages, with handsome cover, uniform in size with the SCIENTIFIC AMERICAN. Terms of subscription for SUPPLEMENT, \$5.00 a year, postage paid, to subscribers. Single copies 10 cents. Sold by all newsdealers throughout the country. Combined Rates.—The SCIENTIFIC AMERICAN and SUPPLEMENT will be sent for one year, postage free, on receipt of seven dollars. Both papers to one address or different addresses, as desired. The safest way to remit is by draft, postal order, or registered letter. Address MUNN & CO., 37 Park Row, N. Y.

Scientific American Export Edition.

The SCIENTIFIC AMERICAN Export Edition is a large and splendid periodical, issued once a month. Each number contains about one hundred large quarto pages, profusely illustrated, embracing: (1.) Most of the plates and pages of the four preceding weekly issues of the SCIENTIFIC AMERICAN, with its splendid engravings and valuable information; (2.) Commercial, trade, and manufacturing announcements of leading houses. Terms for Export Edition, \$5.00 a year, sent prepaid to any part of the world. Single copies 50 cents. Manufacturers and others who desire to secure foreign trade may have large and handsome displays of announcements published in this edition at a very moderate cost. The SCIENTIFIC AMERICAN Export Edition has a large guaranteed circulation in all commercial places throughout the world. Address MUNN & CO., 37 Park Row, New York.

VOL. XLII, No. 10. [NEW SERIES.] Thirty-fifth Year.

NEW YORK, SATURDAY, SEPTEMBER 6, 1879.

Contents.

TABLE OF CONTENTS OF THE SCIENTIFIC AMERICAN SUPPLEMENT No. 192.

For the Week ending September 6, 1879.

Price 10 cents. For sale by all newsdealers.

I. ENGINEERING AND MECHANICS.—Anderson's Gas Washer and Scrubber. I. Illustration. A new apparatus for purifying gas. Gas and Gas Making. II. Continued from SUPPLEMENT No. 183. The process of manufacture. Light and Energy of Electricity and Gas. By J. T. SPRAGUE. Remarkable statements made before the Committee of Parliament on Lighting by Electricity. Evidence of Sir William Thomson. Evidence of Mr. Siemens. The Great Suspension Bridge between New York and Brooklyn. On the Requisite Thickness of Cast Iron Water Pipe under Heavy Pressure. By C. H. M. Blake, C. E. Comparison of English, French, and American estimates. Automatic Feed Water Apparatus, 2 figures. Invention of S. G. Cohnfeld, Zankroa, Saxony. The Polyphemus. The new English torpedo ram. The most extraordinary ship yet built. Unique in form, structure, fitting, armor, and armament. The South Australian Breakwater. Description of the great granite breakwater for Victoria Harbor. The Wear of Steel Rails. Results of an investigation of the comparative wear of various brands of steel rails. New Ironing Machine. Ruhemann & Jacobie's mechanical saw iron. 1 figure.
II. TECHNOLOGY AND CHEMISTRY.—A New Developer for Dry Plates. Important communication to the London Photographers' Meeting, by A. L. HENDERSON. Summer Beverages. Recipes for half a hundred refreshing drinks. Microphotography with Tolles' 1-75 inch objective, 2 figures. By EPHRAIM CUTLER, M. D. History of microphotography. Conditions to be met. Remarks on recent achievements. Tolles' 1-75 inch objective. Nature of Cohesion and its Chemical Significance. By FRIED. MOHR. An able attempt to bring cohesive force into connection with other forces according to the laws of mechanics. Cohesion as a mode of motion. Chemical Composition of Mineral Coal. An examination of the chemical processes by which vegetable matter is converted into mineral coal.
III. METALLURGY.—Aluminum. By CLEMENS WINKLER. History of the art of working aluminum.—Progressive use of aluminum.—Aluminum bronze. Electro-deposition of Nickel. Watson's improvement. Magnetization of Molten Iron. Chernoff's experiments.
IV. ELECTRICITY, LIGHT, HEAT, ETC.—Test of the Eyes by Electric Light. Vision made more acute by electric light. Value of electric light for distant signaling.
V. ART.—Gilt Communion Cup. From the design of A. Ortwein, by Stuttmann. Full size illustration. Hard Wood Chair, 16th century design, with hand wrought tapestry cover. 1 illustration.
VI. MEDICINE, HYGIENE, ETC.—The Care of Young Children. Rules of the Massachusetts State Board of Health.—Food.—Wearing.—Bathing and clothing. Local Anesthesia by Congelation. Experience of Dr. James Arnott.
VII. ETHNOLOGY.—The Affinity of Languages. The Semitic origin of South American Tongues. The Spiritual in Man. The religious instinct as an essential part of man's nature.
VIII. AGRICULTURE, ETC.—The Prize Animals of the International Exhibition of the Royal Agricultural Society, Kilburn, Eng. 6 figures.—Cattle and horses. Culture of the Raspberry. History.—Species.—Soil.—Planting.—Pruning.—Winter protection.—Selection of varieties.—Varieties for home use.—Black cap varieties.
IX. ASTRONOMY, GEOLOGY, ETC.—The Wonders of the Worlds. By CAWILLE FLAMMARION. Saturn and his system. The Geology of Gibraltar. The geological history of the key to the Mediterranean. Dog Lore. Stories of canine intelligence, sagacity, and depravity.

INTELLIGENT WORKMEN NEEDED.

Notice was taken in a recent issue of this paper of the experience of a large shoe manufacturer of this State, who advertised in Boston and New York for twenty-five shoe fitters to work in his factory, offering full current rates and steady work. The advertisement brought one application.

About the same time a Boston firm advertised for a book-keeper, and the next day's mail brought three hundred and forty-seven answers.

During the same month an advertisement for a clerk, in a Detroit paper, brought one hundred and thirty applications the first day, and a greater number of letters and personal applications the next day.

An advertisement for a week in the same city, calling for a good carpenter, brought only four replies.

It is altogether probable that in any considerable city in the land, an advertisement for a book-keeper or retail clerk will bring fifty times as many replies as an advertisement for a fair workman in any trade.

It is also probable that in any and every city the average earnings of clerks are nowhere near so large as the earnings of workmen of average skill in the various trades.

Further, it is fairly certain that, with equal capacity, industry, and thrift, the young man who learns any trade will achieve a reasonable competence sooner than the young man who sticks to clerking; while the chances for materially improving one's condition are more numerous in the trades than behind the counter or at the desk.

Why is it, then, that the boys all want to be clerks? Why is it that intelligent parents encourage them in looking for a chance to "get into business," and in looking down on mechanical employments—as though there could be any calling more wretchedly mechanical than average clerking? Why is it that teachers almost invariably train their pupils to "look above" mechanical pursuits?

What the country wants now is workmen—intelligent, industrious, thrifty workmen; men who can do skillfully the work that waits for the doing—who can invent new means and better processes for developing the crude resources of the land, and for converting brute matter into life sustaining and life-enriching wealth. Mere clerks and record keepers are at a discount. There are too many of them. And the professions, so called, are almost equally crowded with men who have nothing to do. There never was a time when ability to do something real and practical was worth so much as now. Yet our young men swarm after clerkships. Why is it?

HYDROPHOBIA SUCCESSFULLY TREATED WITH CURARE.

The Medical Record of Aug. 9 gives a detailed report of a case of hydrophobia successfully treated with curare, by Dr. Ad. Offenber, of Wickrath, Rhenish Prussia.

The subject was a servant girl, 24 years of age, who was bit in the heel by a rabid Spitz dog, July 28, 1874. Two days after the wound was cauterized by means of a concentrated solution of caustic potash, and shortly after the girl underwent a course of treatment for hydrophobia. Subsequently, for three months or more, the wound was kept suppurating under the direction of a local physician. Seeing that the case was not receiving proper treatment, the pastor of the place brought about the transfer of the patient to a hospital, where she was received October 8. At that time the wound, on the outside of the left foot, extending from the tendo Achillis over the dorsum, presented a reddish granulating surface about the size of the palm of the hand. Under a simple dressing the granulating surface became much smaller, and until October 16 no change was observed in the patient's health and temper. Symptoms of rabies appeared that evening, and by 10:45 P.M. were pronounced and decided. Curare was then injected, under the skin, and the dose was repeated several times during the night, with favorable effects. The last convulsion occurred at twenty-three minutes past four in the morning.

The details of the case would be out of place here; suffice it to say that the patient slowly recovered health and strength, isolated convulsive movements of slight severity occurring at intervals until the 24th, while impaired vision and oversensitiveness of the eyes to light continued still longer. On Dec. 3, the wound on the foot being completely cicatrized, and the patient's general health being good, she was allowed to return to her home. By January, 1875, she was able to resume her duties as servant, though her original health and strength were not restored for more than a year.

The case seems to have been one of genuine hydrophobia, notwithstanding the fact of recovery. The circumstance, however, that the patient attended a hydrophobic neighbor (who was bit by a rabid dog a few days before she was, and died of the disease), witnessing his convulsions and other symptoms, makes her case possibly one of simulation.

EARLY ADVOCATES OF SHIP RAILWAYS.

Since prominence has been given to Capt. Eads' suggestion for a ship railway across the Isthmus of Panama, there have arisen quite a number of claimants to the credit of first proposing this solution to the great problem. Thus far we have seen none antedating the plan illustrated in the first volume of the SCIENTIFIC AMERICAN; and no one seems to have taken the matter more to heart than the late Horace Day, for he went so far as to take out patents for his devices in this connection.

Before that time, however, the project of transporting ships by railways had been enthusiastically advocated by Mr. Philip C. Friese, in "An Essay on Party," published in

this city as early as 1856, and copyrighted the year before. While discussing the competence of the general government to undertake investigations and experiments of a scientific and useful character, for the furtherance of national prosperity, Mr. Friese observed that water conveyances had been increased in size, through many increments, from the slight canoe to the vast steam ship, while land carriages had made no such progress. At that time the rail-car in use was but a small remove from the common road wagon. The American rail-car now shows a considerable increase in carrying capacity, yet the gain in no way approaches that made in shipping.

From this point of view Mr. Friese asked: "Why do we not construct rail-cars as broad and capacious as steamships? Why do we not dip up steamships from a river or ocean, place them in a rail-car, and whirl them overland to another river or ocean? Is it not pitiful that the swift and magnificent vehicles which convey our citizens and our commerce over the stormy deep, and which bear within them the power to scale the lofty mountains and skim the wide plains of our continent, should be checked in their proud career by a narrow isthmus? Why shall not the same power which turns a paddle-wheel through the water be made, by an easy mechanical contrivance, to turn a driving-wheel on a rail? The same power will be immensely more efficient on a rail than on the water, from the fact that friction on a rail is much less than on the water at the same speed, especially at a high rate of speed. Steamships themselves might form the bodies of cars, when placed in a frame, or cradle, over suitable running gear. If the track be made wide enough, cars may be converted into rolling hotels, two or more stories high, and may contain the chambers, parlors, dining-rooms, and other conveniences of steamships, if not of stationary public houses. The great law of economy, in regard to time and power, and fuel and labor, demands the establishment of broad roads, suitable for ships, and for large cars on the principal thoroughfares, say, on the isthmus routes of Panama, Tehuantepec, and Nicaragua, and on the trunk, if not on the branches of the great road which must connect the Atlantic with the Pacific, across the center of our continent. So the Isthmus of Suez may be overcome by a ship railroad. Unless unusual physical obstacles intervene, ship railroads may connect the Black Sea and the Caspian, and perhaps even the Aral, and this with the river Yang Tse Kiang. There would be as much comparative saving of time and power and labor by the employment of large cars instead of small ones, as there is in the employment of ships instead of canoes. Large cars could be driven with safety at a rate of speed not attainable by small ones. If the cars be adapted to steamships, these can leave the Atlantic ports, either going east or west overland, and arrive in the East Indies in a few days, without breaking bulk. For such a road, rivers, lakes, and inland seas would serve as switches and depots."

It is needless to follow Mr. Friese in his remarks concerning the military and naval advantages of ship railways, or to criticise his sweeping indifference to geographical obstructions. Practical railway men will probably laugh now, as they did a quarter of a century ago, at the idea of increasing the economy of ordinary transportation by largely increasing the size of cars; yet it is quite possible that for short portages, to avoid long voyages, ship railways may be more easily constructed and more economically than ship canals; in which case Mr. Friese is obviously entitled to his share of credit for early appreciating their advantages. That the idea of such a means of transportation was original with him is not for a moment to be supposed. The same may be said of Mr. N. W. Evans, who also claims priority in the invention, though he first suggested it in 1854, some ten years after the project had been illustrated in the SCIENTIFIC AMERICAN. Mr. Charles W. S. Heaton, who also puts in a claim, is fully twenty years behind, his proposition having been made as late as "1864, or early in 1865."

AMERICAN VINES IN FRANCE.

A notable illustration of the balance between animal and vegetable life under natural conditions is furnished by the power of American vines to withstand the attacks of phylloxera. For unnumbered ages the conflict between the plant and the insect has been going on in this country, the result being the survival of those species of the grape capable of enduring the attacks of the parasite. This power of resistance has been found to reside in the rapid lignifying of the roots of the American grapes, so that the punctures of the phylloxera are comparatively harmless. They affect the outer bark only, causing little excrescences which fall off like warts. European vines, on the other hand, have not been subject to such invasions (until recently), and are entirely unable to cope with the pest. When pierced by the insect the tender roots decay, and the entire plant perishes. The consequence is that having once been introduced in Europe, as it was about twenty years ago, the phylloxera meets with no resistance, and the indications are that nothing short of the extermination of all European vines will stay its destroying progress.

Our readers are familiar with the decision of the French Commissioners in favor of the substitution of the native grape stocks by those of American origin, as set forth in their official report, translated for the issue of the SCIENTIFIC AMERICAN, dated August 2. Our American Consul at La Rochelle, Mr. George L. Catlin, now writes that the prefect of that department has taken steps to establish there a monster nursery of American grapes (notably the Jacquetz
