#### EDISON'S ELECTRICAL GENERATOR.

To the Editor of the Scientific American:

claim for his electric generator. It has almost brought me into the thick of a controversy; I barely escape and reserve my valor for another day. I protest that up to this time I do not know that there is any disagreement between Mr. Edison and myself. Mr. Upton is indeed Mr. Edison's asthe author of the preposterous claim, or that he ever indorsed 305, to assume, until its falsity is proved, that Mr. Edison in the matter of that preposterous claim, or anything else, has not treated with indignity the revered memories of Ohm, Faraday, and the other fathers of electricity. Mr. Edison. like myself, appears to love peace and quietness, and perit will not long continue if he will take my advice.

The matter in Mr. Upton's letter which is offered as esthe two following sentences:

1.,, The writer of the article (on page 242) simply stated that the machine was so constructed that when used at its October 11th, and of course he knew that he did not realize normal capacity the exterior resistance shall be nine times as that 90 per cent; if he had realized it, he would have been great as the internal, so that ninety per cent of the power of the current could be used outside."

2. "Yet all that was claimed in the article (page 242) was perfectly true, and has been carefully verified."

range, and point blank, hot shot of Calculus (!) right into a picion. gentleman by the name of Weston.

admirable in its way that I quote it again: "Yet all that was friend of mine, had lifted himself over a tall fence by pulling claimed in the article was perfectly true, and was carefully on his boot straps. Many respectable people, influenced verified." Now, as nothing was claimed (on 242) but what is mainly by their exalted and often proved faith in the ability covered by the preposterous claim, this latter is signed, sealed, of X, accepted the announcement as true; for my friend country. Especial attention will be given to this departand indorsed; it is represented as having been verified; it was an eminent authority and exceedingly expert in the ment of the fair. In addition to many novelties there is is reasserted strenuously. Did Mr. Upton pen that sentence, matters relating to the alleged achievement. The hopeful promised an elaborate comparison of the methods of butter with the demonstration on page 305 before his eyes?

Edison claims that he realizes ninety per cent of the power larger part of the community, however, remembering someapplied to this machine in effective external current," and thing of the little lessons in natural philosophy of their thereupon soon follows the explanation that the great econ-school days, denied the claims set up for X, and they scoffed omy is due to the employing of a resistance ratio of 1:9. at him. At this juncture it seemed to me a proper thing Rochester, by the steam cable towing system, arrived at the For the demonstration of the fallacy of this I refer to page and a duty towards a friend and to the public to make an latter city, November 18. The tow consisted of five canal

wire, and make them irons, which ye call magnets, a leetle fence, but they have patent locks on them. (What does this whenever an opportunity offered, to impregnate the spawn heftier, why then yer masheen will be bigger; and howbeit mean?) This S isn't much of a doctor, and I wouldn't trust ye do these things, why ye'll have a bigger masheen. Big-him with a sick cat. He spells Jerusalem with a G, and his ger, did I say? No! Why? For the bearings of the obser- name is mentioned in connection with a neighbor's hen wation is in the application on it." This is perhaps one of roost." This letter of Z's is a great trouble to us, but I pro-Bunsby's greatest efforts.

2. Mr. Upton neatly gets round to the remark that I de- what is to come out of all this embarrassment. that energy is directly proportional to the current, etc., and anything. "The bearings of an obserwation is in the applihe corrects and instructs me by remarking that "foot pounds cations on it." are always measured by the square of the current," etc. Moreover, he says: "Dr. Seeley's distinction of outside from inside current seems to me ridiculous." Mr. Upton, no doubt, made himself quity merry at the discovery of all these blunders of mine. Now I reply: Mr. Upton would not have To the Editor of the Scientific American: discovered those blunders unless he had been looking for body else has found them, or is likely to find them. When we are obliged to write in the telegramic style, as we are The letter of Mr. Upton, on page 337, is far from being sat- when limited as to time and space, we spontaneously take isfactory, at least to myself, for it tends to frustrate the rea- up abbreviated expressions which hypercritics might object lization of the plans I had suggested of relieving Mr. Edison to. Thus we may use the letter C for current or strength of from the appearance of having put forth a preposterous current or energy of current, and no one but the hypercritics will misunderstand or complain unless some positive ambiguity results. Life is too short to write with a view of satisfying the hypercritics. I might quote many precedents for the expressions I used, but I content myself with a single one, for the reason that it is from an authority which, I am sistant, and his letter purports to be authorized, and yet I sure, Mr. Upton greatly respects; the authority, please uncannot find anywhere irrefragable proof that Mr. Edison is derstand, is not Mr. Edison: possibly it is Mr. Upton himself. If Mr. Upton will turn to page 242 he will find thereon it. I believe it is best, indeed, as I did in my article on page the preposterous claim as originally propounded, and he will observe that the last two words are "external current." How is it now? Will Mr. Upton ever again say, "the distinction of outside from inside current seems to me ridiculous?"

After finishing my case, Mr. Upton goes on: "In conclusion, I may state that the methods which are employed for haps the guilty author of that preposterous claim will never testing Mr. Edison's machines were fully described in a be discovered and punished. The disagreement which so paper read by me (in August) at the Saratoga meeting of far is developed is between Mr. Upton and myself only, and the American Association. At that time (in August), as now, full results were withheld until Mr. Edison was fully satisfied with the performance of the machine." , I find in pecially pertinent to the preposterous claim is comprised in this pretty plain evidence that Mr. Edison did not—and this I have contended for from the first-put forth the preposterous claim. He had full tests in August as well as on fully satisfied with the performance of his machine, for his machine would be the greatest invention of all time.

Mr. Upton concludes by mentioning that Mr. Edison hopes soon to have a machine with a resistance ratio of 1:20. I have not been able to satisfy myself as to what are I trust this is not quite true. It would be almost a public the intent and meaning of sentence 1. I cannot find out what calamity if Mr. Edison should employ his great talent on "normal capacity" is. I cannot find out what the thing is such a puerility. I quote again: "His machine is so made which was simply stated; why did not Mr. Upton state it that it would be impossible touse it with the same resistance simply? Among various theories of the intent of sentence outside as inside, as it would heat the wire on the arma-1 which I have worked out, the most plausible is, that the ture so as almost to burn it, by carrying a current so much sentence is a device like those terrible engines which Knicker- in excess of that for which it was intended." The truth of bocker, in his history of New York, relates were employed this must be evident to any one who is a tolerable expert on by the ponderous Dutch warriors. This theory derives con- machines; but I quote it as further evidence that Mr. Edison firmation from the fact, which appears on page 308, that Mr. is not the author of the preposterous claim, and to raise the Upton found it a fair thing to fire, without warning, at short 'query whether we cannot relieve Mr. Upton also from sus-

A few weeks since (suppose) the startling announcement But sentence 2 is direct, explicit, and emphatic. It is so was made in the papers that X, a dear and distinguished tries have already been made by intending exhibitors, and people at once began speculations on the applications of X's and cheese manufacture as employed a hundred years ago I reproduce, from page 242, the preposterous claim: "Mr. discovery to rapid transit and other great projects. CHARLES A. SEELEY.

#### A Note from Mr. Edison.-The Hughes Microphone and the Blake Transmitter.

In reference to the communication from T. D. Lockwood, which appeared in the Scientific American (No. 21), November 22, 1879, regarding the carbon telephone, I wish to say that his statement that the scientific men of Europe have supported the claim of Hughes that the microphonic action is different from the carbon telephone, is absolutely false, and as a fact just the contrary is the case. Also that the Patent Office has declared that the Blake transmitter filed in the Patent Office in 1879 infringes several of my patents filed in 1877. In fact there is not the slightest difference between the carbon transmitter and the so-called Blake transmitter, except in size of parts and delicacy of adjustment.

T. A. Edison.

Menlo Park, N. J., November, 1879.

#### CROSS-BREEDING AMONG FISH.

Mr. Robert B. Roosevelt, so well known in connection with fish breeding, is responsible for some surprising assertions with regard to the inter-crossing of distinct species of fish. Some two years ago the eggs of a shad were placed in a pan of fresh water which could not have contained any milt of the male shad. This done, the eggs were mixed with the milt of a striped bass and they were immediately fertilized. They were then placed in the shad-hatching boxes, and fully 10,000 young cross-breeds were the result. They were turned into the river at the proper time, and it is not yet time for them to return, if they follow the customs of their mother.

That the hybrids are likely to thrive and breed is thought probable after the perfect success that has followed the crossing of the California salmon and the common brook trout. Mr. Roosevelt says: "We have crossed fifteen or twenty different breeds, and all successfully, and I can assure you that the result is a strong argument in favor of Darwinism, for it shows that all fish may possibly have grown out of one or two varieties. This would account for what is called the 'land-locked salmon' which is found in lakes having no communication with the sea. The object of this crossing and breeding is to improve the fish, just as they cross neat cattle and horses, and even fruits and flowers. The result will be to make fish food plenty, and to add a large number of 'queer fish' to the number already in existence.'

## THE INTERNATIONAL DAIRY FAIR,

The second annual International Dairy Fair in this city, to be opened in the American Institute building, December 8, promises to be the largest and finest exhibition of the kind ever held in this country. Nearly three thousand enten thousand dollars will be given as premiums. It is expected that at least 300 specimens of fine cattle will be exhibited, representing the most celebrated herds in the
