NEW BOOKS AND PUBLICATIONS.

UEBER DAS TECHNISCHE SCHUL UND VEREINS-WESEN FRANKREICHS. VON WILHELM VON NORDLING. Wien, Pest. Leipzig: A. Hartleben. 1881. 54 pp. (Technical Schools and Societies in France.)

The author gives a brief description of the origin and growth of the several institutions for technical education in France, their average attendance, course of study, and the several societies of the former scholars of these institutions. Among the schools and colleges mentioned are: the Ecole polytechnique, Ecole des Mines, Ecole des Ponts et Chaussees, Ecole des Arts ot Metiers, Ecole des Arts et Manufactures, and several others. From this work it will be seen that there are 13 technical societies, with 17,000 members.

PARIS UNIVERSAL EXPOSITION OF 1878. Reports of the United States Commission. Washington: U. S. Government Printing Office. 5 vols. 8vo. Illustrated. 1880.

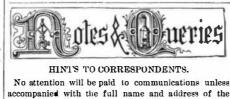

The several volumes of these reports comprise: (1) Report of Commissioner-General R. C. McCormick, with accompanying papers, including lists of exhibitors and awards. (2) Report of Commissioners William W. Story (Fine Arts); Joshua L. Chamberlain (Education); Andrew D. White (Political Education): Elliot C. Jewett (Manual Training Schools); John T. Norton (Wood Carving); Henry Howard (Textile Fabrics). (3) Daniel J. Morrell (Iron and Steel); William P. Blake (Ceramics and Glass and Glassware); F. P. Baker (Forestry); P. M. B. Young (Cotton Cultivation). (4) Thos. E. Jenkins (Chemical Processes): James D. Hague (Mining Industries); A. J. Sweeney (Steam and Gas Engines); William T. Porter (Machines and Machine Tools); Edward H. Knight (Clocks and Watches); William J. Anderson (Railway Apparatus). (5) Edward H. Knight (Agricultural Implements); John J. Woodman (Agricultural Products); Samuel Dysart (Live Stock); George W. Campbell (Horticulture); Thomas B. Ferguson (Pisciculture). The several reports are illustrated with engravings and charts, some of them profusely, and the several volumes are well indexed. That they contain a vast store of practical information and suggestion goes without telling. To a great extent the information here given was set before the public in our newspapers and technical journals during the holding of the exhibition; but it is well worth preserving in this more compact and acces sible form. For the set of reports on our table our thanks are due to Commissioner E H. Knight.

HYGIENE AND TREATMENT OF CATARRH. By Thos. F. Rumbold, M.D. Part II. St. Louis: George O. Rumbold & Co.

Our favorable opinion of the first part of Dr. Rumbold's work, treating of the hygiene of catarrh, was expressed some months ago. The second part is devoted to therapentic and operative measures for chronic catarrhal inflammation of the nose, throat, and ears. The work is plainly written, and illustrated by forty engravings of anatomical structures, apparatus, operations, etc. Thoughout the author insists on the paramount importance of hygienic measures and the advantage of non-irritating remedies and mild methods of treatment.

HAND-BOOK OF USEFUL TABLES FOR THE LUMBERMAN, FARMER, AND MECHANIC. Ithaca, N. Y.: Finch & Apgar. 25 cents.

A handy little book. especially for the lumberman. The numerous tables are the work of a graduate of Cornell University and presumably accurate.

writer.

(2) H. E. K. writes: My cistern water sibly slightly auriperty . 4. Chalcopyrite-copper iron water being through the filling and overflow pipes. I have raised the lid now so that it can have air. Is there anything I can put into the water to purify it, or will it A. B. B .- No. 1. Gypsum-used for making plasterpurify itself by contact with what air reaches it through (plaster of Paris). Nos. 2 and 4. Silicious lime carbonan opening at the lid 1 foot by 3 feet ? A. Put into the water a few bushels of freshly burned charcoal in granular powder (free from fine dust). Stir up the water and let it settle. If this does not remedy the evil it is better to clean out the cistern. Surface contact with air will be of little use.

(3) M. W. C. asks: 1. Are the black rubber combs so much in use injurious to the hair or beard ? I have somewhere read so. A. We think not 2. Does the decomposition of white rubber corks by nitric acid render the latter unfit for use as a caustic A. Yes; nitric acid should always be kept in glass stoppered bottles.

(4) C. W. W. asks: Can you furnish me with any information in regard to cleaning stone work (cut) in front of buildings? Is there any process, and where and how can it be obtained ? A. Use short, stiff wire scratch brushes, and a dressing hammer, if necessary, with plenty of water. If the stone is granite, traprock, or sandstone, dilute muriatic or sulphuric acid may prove useful; but it is better to do without them if possible.

(5) N. R. B. asks: Are there any nickel mines now worked in the United States ? How is it taken from the ore: by smelting or by chemicals ? I send you a specimen of mineral, marked as above, found here in large quantities. Please inform me what it is through your columns. A. There are several nickel mines in the United States. The metal is usually obtained from the ore by solution and precipitation. and is finally reduced in a furnace. Consult Percy's Metallurgy. The minerals are noticed under appropriate heading.

(6) W. K. P. asks for a plain and not expensive mode of bleaching wax; but the bees feed nearly exclusively here on vine and fruit, which, ac cording to my experience, makes a difference in the process. A. One of the best methods of bleaching beeswax is that of exposure to sunlight under glass. The wax is cut in very fine shavings, and spread out so that all parts of it are acted upon alike. Anothergood method is to melt the wax and stir it about for some time with a mixture of fine granular charcoal (free from dust) and bisulphite of lime-1 of sulphite, 3 of charcoal, and 30 of wax. The charcoal and salt are separated by straining.

(7) H. C. asks: What is best for making a waterproof joint on a flagstone sidewalk? Stones are all iron matched. Is lead good ? A. Lead does very well. Pack the lower part of the joint with oakum.

(8) D. W. O. asks: What materials are B used in the preparation of cement or asphaltum for walks ? What should be their condition, their proportion, and the best manner of laying ? A. See Footwalk Pavements, SUPPLEMENT, No. 83, and Street Pavements and Sidewalks, SUPPLEMENT, No. 33.

(9) E. S. writes: I wish to separate the pulp of cooked apples from the rinds and cores. It can be thrown out by putting them in a perforated cylinder. Please let me know which you think would be best: a C perpendicular or horizontal motion. Would not there be less danger of it clogging if the motion was irregular ? How many revolutions ought it have per minute? A. You might use with advantage for this purpose a centrifugal machine. The horizontal is preferable to the perpendicular motion. The motion should be as regular as possible. Such machines are usually rim at from 500 to 1,000 revolutions per minute.

(10) H. P. H. asks: 1. Is the dirt or any foreign substance in water taken up in the steam to any appreciable extent ? A. Yes, if dirty water be used, containing much vegetable matter. 3. Can you give me the ratio of speed to power required ? instance, if I run an emery wheel, 18x3, 500 revolutions Ca per minute, how much more power will it take to run it 1,000 revolutions ? A. It depends upon the kind of Cl work you wish to do on the wheel. It could not be determined except by direct experiment.

(11) W. L. D. and W. T. T., who ask about a process for producing a large number of copies of manuscripts, etc., by the gelatin process, are referred to article on Stencil Copying Process, page 65, curren t volume.

(12) I. M. asks how to render wood waterproof. A composition not containing alum would be preferable, A. Dry and saturate the wood as far as possible with hot paraffine oil or melted paraffine.

MINERALS, ETC.-Specimens have been reeived from the following correspondents, and

does not smell pure, owing undoubtedly, to the top sulphide 6. Chiehy sulphide and phosphate of copper being tightly closed and the only air reaching the and sulphide of iron.-J. W. M.- Quartz and feldspar containing much graphite. If the sample correctly represents a large body of rock the property is valuable .-ate. 3. A ferruginous clay-could be used for making bricks and cheap pottery .-- J. C -- 1. Silicious and ferruginous limestone. 2. Limestone containing traces of copper and iron sulphides.-N. G. & Co.-Galena-sulphide of lead-a valuable lead ore. It probably contains a trace of silver.

INDEX OF INVENTIONS FOR WHICH

Letters Patent of the United States were Granted in the Week Ending

July 26, 1881,

AND EACH BEARING THAT DATE. [Those marked (r) are reissued patents.]

A printed copy of the specification and drawing of any patent in the annexed list, also of any patent issued since 1866, will be furnished from this office for 25 cents. In ordering please state the number and date of th patent desired and remit to Munn & Co., 37 Park Row, New York city. We also furnish copies of patents granted prior to 1866; but at increased cost, as the specifications not being printed, must be copied by hand.
