## Hygienic and Sanative Meastres. for

 Chronic Catarral Inflammation ofthe Nose, Throat, and Ears By Thos. F. Rumbold. M. D. St. Louis: Medica Journal Publishing Company. 1882
The first edition of this work was favorably noticed
about a year ago. The author is more than ever couliabout a year ago. The author is more than ever couti-
dent that the most successful method of eradicating dent that the enost successful method of eradicating
catarrhal infammation of the respiratory organs in brough the enforcement of proper hygienic and sana tive measures; this especially with the young.
Treatise on the Metallurgy of Iron
By H. Bauerman. No 176 . Weale's RudiBy H. Bauerman. No 176, Weale's Rudi
mentary Series. London: Crosby, Lock mentary Series. Lo
wood \& Company.
The improvements in this, the fifth edition of Mr Bauerman's well known treatise are found in a revision
of the chemical notation; considerable additions to the chapters on steel making to cover the more important recent advances in the art; and some valuabte new matter with respect to the hematite deposits of Spain and
Norih Africa, the oolitic ores of Luxemburg and Lorraine. and the more important ore deposits of A merica and India.
Dress and Care of the Feet. By Prof.
P.
Peter Kohter. GF THE Petr. By Prof.
New York.

This is a very short treatise on a very important subject to most persons The evenable author has treated the feet of some of New York's most distinguished citi-
zens for a quarter of a century, and at the end of his volume he a quarter of a century, and at the end of his

HINTS TO CORRESPUNDENTS.
No attention will be paid to communcations unless accompanied with the full name and address of the writer.
Namesand addresses of correspondents will not be Wen to inquirers.
We renew our request that correspondents, in referring
of former answers or articles, will be kind enourb to name tue date of the paper and the page, or the number vame te date of
of the question.
Correspondents whose inquiries do not appear after
a reasonabie time should repeat them. lished, they may conclude tuat, for good reasons, the Editor declines them.
Persons desiring special information which is purely of a personal character, and not of general incerest,
should remit from $\$ 1$ io $\$ 5$, according to the subject, we cannol be expecteil to spend time and labor to obtain such information withount remuneration.
Any numbers of tive SCIENTIPrC Amentcan SoppizKNN referred to in these columns may be had at this Kinn
Correspondents sending samples of minerals, etc.,
for examination, should be careful to distinctly mark or label their specimens so as to avoid error in their identification.
(1) A. F. W. asks: Will you inform us what is the active substance nsed in the so-called
bleaching powders (nsed for bleaching hair etc) bleaching powders (used for bleaching hair, etc.) ? Is
it sulphide of barium
Also please explain its action. A. It is the peroxide of barium, to be bought. in bulk in the market, and contains a large proportion of loosely
combined oxygen gas, which in t.e peroxide of hydrogen produceal has the powertul bleaching action.
(2) G. C. W. asks: 1. What size propeller must I have to run a skiff $15 y$ feet long by $3 \%$ feet
beam, to make six to seven miles per hour? A .18 beam, to mate six 10 seven miles per hourr A. 18
inches diameter and $23 / 2$ feet pitch. 2 How many revolutions should the propeller make per minute? A. 300 to 350. 3. Is a two or four bladed propeller best? A.
Two bladed. 4. What should the weight be ofit? A . Two bladed. 4. What should the weight be ofit?
About 70 or 80 pounds.
(3) C. W. G. writes: I recently bought a ot of books at auction that are very badly stamped
with blue ink which greatly disfigures them; can you give me a recipe that will remove the llue ink withont disfiguring the paper? A. Try a little peroxide of hydro-
gen solution, and if this fails, dilnted hydrochloric acid,
(4) E. E. P. asks: 1. Where can I obtain Dr. Henry Draper's paper on silvered glass specula ? A Draper's Method of Sivering Specula, ScIent mic dmer-
ICAN SUPPLEMENT 105. SUPPLEMENT 121 has several other methods. 2. How large should the small epeculum of a telescope of the Newtonian form of 834 inches aperture and 80 inches focal length be, and in what posi-
ion should it be placed, its shape being oval? A. The tion should it be placed, its shape being oval? A. The
size of a small speculum for a Newtonian form of telescope should be one-fifth larger in its lesser diameter
than the field than the field $\boldsymbol{g}^{2} 4.5$ of your lowest eye piece, and should
be an ellipse of the proportions of a cylinder cut at $45^{\circ}$, and may be placed in the optical axis of the telescope for the best effect, although they have been placed in with the eye pieces at other positions than at right angles to the tubes, as well as being dispensed with, as in the Herschelian and Ross form with their accompanying distortion of image and increase of light.
(5) T. H. J. asks for directions for softening or annealing stecl sufficiently to admit of cutting letters
on the face of block by hand. A. For annealing steel for cutting with a graver by the water process, heat the steel to a full red, let it cool slowly in dry lime or fine
ashes untilit is biack, then dipin water.
(6) G. G. G. asks how bort and carbonado. are attached to drills, and how the drills are worked to
prevent fracture of the brittle minerals? A. The setting of bort or carbons in drills is done by boring holes in the iron, where the bort or carbon is required to be placed, and cutting the sides of the holes with small
chisels or gravers of the proper shape to receive it to the depth sufficient to allow of the adjoining metal being driven up against the bort with small sets or
chasing tools, so as to partially inclose it with a firm metallic border, leaving the carbon projectingjust above the surrounding surface. Such drills must be handled very carefully and should never be dropped upon the low, or of iron tubing with the carbons set made hollow, or of iron tubing with the carbons set on the outer tube and take out a solid core of rock in the center. They are revolved quickly with light feed, and cleared with a stream of water down the center.
(7) J. S. G. asks: 1. Is it unbealthy to use pulverized borax in washing the hands and race, say than soap. A. Borax is an excellent detergent and
ther harmless to the skin, even if used as often as you mention. 2. Are cockroaches not useful from a sanitary point of the question? I know they are disagreeable to have around. A. Cockroaches are probably ex-
cellent for removing the filth that briugs them to a (8) L. R. S. asks how to remove paint spots rom a rubber coat? A. Try some aqua ammonia, or if this will not answer, spirits of turpentine rubbed on (9) C:S. asks: Can you give form of furnace and process for annealing gray iron casting? A. Gray iron work is annealed by packing in iron bozes coke mixed with fine ashes. In fact, any material that does not melt will exclude air or prevent oxidation. Furnaces are made similar to the reverberatory furnace for ores and iron or a puddler's furnace. Heat only to a cording to and cont.
(10) E T. L. asks how the gloss can be rought back on a marble slab upo wis or partso the slab on which the polish has been destroyed with oxide of tin and water, by rubbing with a rag or cush
ion of cloth. Use the oxide of tin. or putty powder as he marble polishers callit, about as thick as cream.
(11) C. P. asks how to put drill and cotton in oil tomake them like those sailors' yellow suits and
the black horse covers? What kind of paint do you use, and how to fix the oilp A. The materials are first sized and then dipped into oil which has been mixed with yellow ocher for yellow, or fine lamp black for black; only a little color is required. The oil is fixed by dry (12) J. A. F. writes: 1. Wishing to set a (12) J. A. F. writes: 1. Wishing to set a
pair of return tubular boilers $39^{\prime \prime} \times 14^{\prime}$, what height pair of return tubular boilers $39^{\prime \prime} \times 14$, what height
should we have boiler above grates? A. Set the boilers 18 inches above the grate. 2. What size stack? A. should the bridge wall be, and how close to boilers? A. Bridge wall at back of grate, 6 inches clear from boiler. 4. Should it be filled with dirt back of bridge? A. Do not fill in back of bridge wall. The chamber gathers the heavy ashes, and prevents excessive accumulation in
flues. 5. What size of safety valve, either lever or pop le, hin h the lever kind. 6. Should we have gange cocks on one
or both boilers? or both boilers? Fuel to be used, hard wood sawdust,
with some four-foot slabs? A. Put gauge cocks and
(13) W. F. H. says: Please explain the mys tery of a horse hair; why it assumes life when kept under water? A. It does not assume life. The borse
hair snake, so called, is a worm which is a parasite of crickets and grasshoppers during most of its life. (14) G L G. asks: I would like to know how to boil meerschaum pipe in wax to make it color. What
kind of waxandbow long to boil it, as well as degree of kind of waxand bow long to boil it, as well as degree of
heat required? A. This is a nart that requires considerable skill and is performed as follows: A water bath is filled with pure beeswax in small pieces, and this care-
fully melted, when the pipe or other article is immersed in it and boiled for from twenty-five minutes to half an hour, when it is removed, the adkering wax wiped off, and the work is finished. The wax must be a
pure and is very difficult to find in the market.
(15) G. F. N. asks as to the difference, if any, between carbolic acid and phenic acid: the color
in the latter and a seemingly slight difference in the odor of the two acids make me think they are not the same. A. There is no difference between them.
(16) $\underset{X}{X}$. Y. Z. inquires: What is the sub
stance called " foliated graphite"? It was mentioned to
me as being good for packing stuffing boxes. A. Folime as being good for packing stufing boxes. A. Foli-
ated graphite is the fiaky form of pumbago and may be ated graphite is the fiaky form of pumbago and mist.
readily bought as such from any wholesale druggist.
(17) C. H. writes: A friend of mine says a
plavet is a star, and twinkles. I say that a planet is no
star, and does not twiulile. Please inform me who is right? A. Planets are not stars. Their light is steadier than that of the stars; but under some conditions of the
atmosphere they twinkle. (18) E. P. C. writes : On page 4,976, of an article on Electric Light Apparatus states, that "the troughs" (for the batiery) " are made of mahogany, put
together withbrass screws, and well saturated with an intogether with brass screws, and well sa turated with an in-
sulating compound which also makes them acid proof." Will you please tell me through y our notes and queries column of a suitable insulating compound, and the
(19) J. H. P. writes: During spring and berry time robins were very numerous, but for many
weeks I have not heard or seen one, yet almost always weeks Ihave not heard or seen one, yet almost always
justas winter sets in, or after the first snowfall, they appear again and are often seen eating frozen apples and mounain ash berries. Where do they spend the long fall vacation? A. Robins are abundant in spring, going north. Those that stop to breed scatter, but do not go far from their breeding places. The fall abundance is due to their massing for migration, then
reanforced by migrants from the north.
(20) J. L. H. asks: What is the right width amidships and depth forward and aft for a tug boat 56 right boiler, numberand size of tubes, thickness of iron boiier plate and bobiler heads. Dimensions of fire box. Alsodiameter and length of engine cylinder required
to drive boat 12 knots per hour. Also diameter and pitch of propeller and number of blades. And diameter of iron shaft? A. 56 feet on water line by $131 / 2$, or 13 feet
heam by 5 feet 9 inches hold. Engine, $12 \times 12$ inches. Vertical tubular boiler, $51 / 1 /$ feetdiameter, 7 feet 8 inches high, with 1502 -inch tubes. Propeller, 5 feet dia-
meter and $71 / 4$ feet pitch; 4 blades. Shaft, $41 / 2$ inches diameter.
(21) B. F. B. asks: Is it more economical to heat a private residence with steam than by hot air? If so, is it a better heat and more conducive to health than hot air? What are the objections to steam for the
purpose of heating privateresidences by steam heaters? What proportion of private residences in your city are heated by steam heaters to hot air furnaees? I have heard it said that a large proportion of dwellings in the
Eastern cities are heated by steam heaters. Is this so? Eastern cities are heated by steam heaters. Is this so? A. It is more economical to heat small houses with hot
air furnaces, provided they are of the best kind. There is no economy in purchasing small, cheap heaters Steam apparatus is considered the most healthy, be-
cause there is less liability to vitiation of the air by escapinggas, but there is no reason whiy a well made furnace shouia not be perfectly healthy Thousands of private residences in the Eastern and Middle States are heated by steam apparatus with perfect satisfaction and safety, the pressure in the boilers being only fro
half to five pounds, seldom beyond ten pounds. half to five pounds, seldom beyond ten pounds.
(32) J. B. \& B. write: We have put i store recently some show windows: in the inside we have during the evening lamps burning. In order to let
the sterm ont we have bored sixholes in the sash, and yet the steam settles on the window as ever. What is the cause of that 9 A. The condensation is due to warmth inside of the window. In order to preventcon-
densation, the air space between the outside and inside
windows must be kept cool so that the air inside will have about the same temperature as the air outside.
By arranging holes of sufficient size top and bottom By arranging holes of sufficient size top and bottom,
you can secure a sufficiently cool temperature to kee you can secure a sufficie
the glass always clear.
(23) C. T. S. asks: What is the best way to build an ice house, and which is the best way to pack
ice? A. The usual way of building ice houses is toput up a rough frame, so as to make the inside and outside boarding six, eight, or ten inches apart, according to the in with hay and pack close as the frame is boarded up. The roof should also be double. If the soil is porou or the position such that the tloor can be dranned, it is
sometimes found economical to sink the house below the level of the ground severalfeet, and bank around with the dirt thrown out of the cellar. In packing the ice, hay, and preferably sawdust if it can be obtained, are used. The main point is to exclude air and heat
keep a thickness of one foot of packing all around next the sides. Batten the outside boarding, or if you ca afford it cover the outside of the frame with tar paper
(24) S. T. M. asks: How are type writer ribbnns made? What composition is used? A. Th glycerine.
