

Scientific American.

ESTABLISHED 1845.

MUNN & CO., Editors and Proprietors.

PUBLISHED WEEKLY AT

No. 261 BROADWAY, NEW YORK.

O. D. MUNN.

A. E. BEACH.

TERMS FOR THE SCIENTIFIC AMERICAN.

One copy, one year postage included. \$3 20
One copy, six months postage included. 1 60

Clubs.—One extra copy of THE SCIENTIFIC AMERICAN will be supplied gratis for every club of five subscribers at \$3.20 each; additional copies at same proportionate rate. Postage prepaid. Remit by postal order. Address

MUNN & CO., 261 Broadway, corner of Warren street, New York.

The Scientific American Supplement

is a distinct paper from the SCIENTIFIC AMERICAN. THE SUPPLEMENT is issued weekly. Every number contains 16 octavo pages, uniform in size with SCIENTIFIC AMERICAN. Terms of subscription for SUPPLEMENT, \$5.00 a year, postage paid, to subscribers. Single copies, 19 cents. Sold by all news dealers throughout the country

Combined Rates.—The SCIENTIFIC AMERICAN and SUPPLEMENT will be sent for one year postage free, on receipt of seven dollars. Both papers to one address or different addresses as desired.

The safest way to remit is by draft, postal order, or registered letter.

Address MUNN & CO., 261 Broadway, corner of Warren street, New York.

Scientific American Export Edition.

The SCIENTIFIC AMERICAN Export Edition is a large and splendid periodical, issued once a month. Each number contains about one hundred large quarto pages, profusely illustrated, embracing: (1.) Most of the plates and pages of the four preceding weekly issues of the SCIENTIFIC AMERICAN, with its splendid engravings and valuable information; (2.) Commercial, trade, and manufacturing announcements of leading houses. Terms for Export Edition, \$5.00 a year, sent prepaid to any part of the world. Single copies 50 cents. Manufacturers and others who desire to secure foreign trade may have large and handsomely displayed announcements published in this edition at a very moderate cost.

The SCIENTIFIC AMERICAN Export Edition has a large guaranteed circulation in all commercial places throughout the world. Address MUNN & CO., 261 Broadway, corner of Warren street, New York.

NEW YORK, SATURDAY, DECEMBER 9, 1882.

Contents.

(Illustrated articles are marked with an asterisk.)

Table listing various articles such as Agricultural Inventions, Hirsch's flattening window glass, and others with their respective page numbers.

TABLE OF CONTENTS OF

THE SCIENTIFIC AMERICAN SUPPLEMENT

No. 362,

For the Week ending December 9, 1882.

Price 10 cents. For sale by all newsdealers.

Detailed table of contents for the supplement, categorized by subject like ENGINEERING AND MECHANICS, TECHNOLOGY AND CHEMISTRY, etc.

PROGRESS OF THE STREET STEAM SUPPLY IN NEW YORK CITY.

The laying of steam pipes in the streets of the lower part of our city has made rapid progress the past summer and fall, almost too rapid, we think, to be substantial and free from the every-day mishaps now occurring.

Although there may be competition wherever there are rival lines, as well as the cutting of rates, the gain is not equal to the nuisance of the continued disturbance of the streets and increased temperature of the water supply from the proximity of so many steam pipes.

Is there not room enough for the expansion of two live steam companies in our great city without doubling up their lines of steam pipes under our streets to the detriment of all other interests?

The blockade of the streets alone by one company is a nuisance, and what must it be when the rival company repeats it; but when packings blow out to such an extent as to fill the streets with steam and jeopardize life, it becomes time to suspend the extension of the lines, and endeavor to perfect the work already done.

The general plans of distribution of the two steam companies are nearly the same, but the details of the laying of the street mains vary somewhat. The flange packings of the New York Company are corrugated copper gaskets or washers. These have so far proved the best that have been tried, but the paper gaskets upon the valve bonnets have been the cause of several blowouts.

This class of expansion joints have had a long trial, and found faultless for small variations, but having so little range they are hardly a criterion by which to judge of the success of the copper ones, which are subjected to much strain and flexure.

The flange packings of the American Co., as we hear, were at first made with gaskets of compounds of rubber, plum-bago, and other materials, a variety of which are made under various patents. They are too plastic, and are liable to give way under pressure and heat before they become set or vulcanized, and therefore require setting up by the screws or bolts for some time previous to closing the trenches.

The line pipe of this company rides upon friction rollers within a box of heavy plank, which is thoroughly treated with coal tar, the top and bottom of the box being laid cross-wise and filled in with pulverized charcoal.

The expansion joints are of the sliding type, made of brass or composition, with brass bearings. They have a great range, and therefore require a less number in a given distance than those of the other company, but the packings require frequent attention.

The regulations, capabilities, and extent of steam supply by these companies, will be considered in a future article.

GENERAL AND LOCAL WEATHER SERVICE.

A convention of volunteer weather observers was held at Indianapolis, Ind., November 15. Governor Porter opened the exercises with an interesting address on the Indiana Weather Service, tracing its history and pointing out the value of the services rendered by the volunteer observers in the seventy-six counties of the State.

Lieutenant Dunwoody, First Assistant in the Chief Signal Office in Washington, who was presented to those intending to engage in the work, said that State weather services were organized during the past year in Ohio, Indiana, Illinois, Michigan, Kansas, Nebraska, Missouri, and New Jersey. The most perfect State service is that in Iowa, which was the first organized, and is operated under a State law. The object of the State service is to observe and utilize every feature of the weather that affects the prosperity of the inhabitants of the State as to crops, health, life, etc.

importance, such as predictions of frosts, tornadoes, and floods. The service was organized in Indiana last spring, and is the most extensive of its kind in any one State. Excellent work from it is expected.

The frost warnings lately inaugurated for the benefit of the fruit, cotton, and tobacco growers have proved of great value to agriculture, and similar warnings for other interests are soon to be inaugurated. The department at Washington regards the Indiana service as one of the best of these, as the reports show great skill and proficiency in the work.

CONVENTION OF STREET RAILWAY OFFICIALS.

A convention of street railway officials is to be held in Boston, December 12. Its purpose is the formation of an association for the promotion of scientific and practical knowledge relating to the construction, equipment, and management of street railways; an interchange of information and ideas, and the cultivation of a spirit of fraternity among those engaged in street railway enterprises.

Considering the wide extent and enormous financial importance of the street railway interests of the country, and the number of men employed, the field for such an association is manifestly a large and inviting one. Properly organized and conducted, the proposed association cannot fail to be of advantage, both to the street railway service and to the public. If, on the contrary, it is to be pervaded by a spirit of opposition to inventors and their improvements in the means and methods of the service, after the fashion set by certain other railway organizations, it had better never come into existence.

HOW OUR FARMERS ARE HELPED BY THE PATENT SYSTEM.

There has been this fall what is called a crisis in the grain trade of Russia.

When asked the cause of it, a grain merchant of St. Petersburg replied: "The American cheap grain has completely undermined us. It is clear that we cannot compete with our transatlantic friends, at least under present circumstances. Our agriculture is in a primitive state, and our transportation is in its infancy. In spite of dear labor, American grain costs the producer only half as much as Russian grain."

This great contrast in the relative situations of the grain merchants of Russia and America but faintly illustrates the contrast in the positions of the farmers of the two countries.

With American facilities for cheap and rapid transportation, the price of grain at the farm much more nearly approximates the seaboard price than is the case in Russia. In other words, while it does not cost the newly immigrated Russian farmer in the West half as much to raise a bushel of grain as it does his brother in Russia, he gets for it a far greater share of the Liverpool market price; and all other American farmers enjoy the same advantage over their chief competitors for the export grain trade of the world.

These advantages are in no way due, it will be observed, to the superior skill or thrift of the farmer himself. He has at command—thanks to the geographical position of his farm—better means for producing and handling his crops and for getting them to market. These alone give him his commanding position; and for these he is indebted entirely to the activity of our inventors and manufacturers. The concurrent testimony of all our inventors and manufacturers is that their productive activity has been greatly stimulated and sustained, if it was not originally awakened by the inducements held out by the Patent Office in moderate fees and the protection of inventors' and manufacturers' rights which the patent laws afford.

And yet, because of minute and incidental inconveniences arising from the application of the patent laws—in many cases attributable largely to contributory negligence on the part of the sufferers—a considerable class of our Western farmers would wipe out those features of the patent system which make it most effective in stimulating invention.

Without their improved machinery—which has been invented because improvements were patentable and thereby defensible and therefore valuable—the enormous and cheap grain crops of the West could have no existence. Without our means of cheap transportation—which have been invented because patentable, protectable, and profitable—the grain, if produced, would have to rot in the bins or be burned for fuel, for it would not pay for hauling half across the continent. Without the enormous home market for ninety-nine hundredths of our grain production—due mainly to the multiplication of non-producing consumers employed in purely mechanical pursuits which have their basis in the patent system—the surplus of agricultural products beyond what could be exported would make such crops as we now raise unprofitable to the growers, even at the present low cost of production.

Whatever way we may look at it, the disposition of many
