## ENGINEERING INVENTIONS

A device to prevent nuts of rail bolts from being Mr. Walter B Johnson, of Waterloo, Ind. A metal strip that will fit between two adjoining nuts is riveted
to the outer surface of a washer plate, and is held a to the outer surface of a washer plate, and is held a
short distance from this plate by a mmall block. The
bolts of the nuts to ne locked pass plates and rail, and rubber washers interposed between the washer plate and the fish plate. The ends of the metallic strip are then pressed against the washer plate,
and the nuts are firmly screwed on the rail bolts, and the and the nuts are firmly screwed on the rail bolts, and the
ends of the strip are then drawn outward, so that it will be straightened. If the nuts loosen they will strike against the
prevented.
An improved car coupling has been patented by Mr. Sylvester Oar, of Kansas, III. A transverse rock shaf
is journaled in boxes on the end of the car, and is pro is journaled in boxes on the end of the car, and is pro-
vided with collars on the outside of the boxes. The
outer ends of the shafts are bent to form handles, outer ends of the shafts are bent to form handles, and a
spiral spring is placed on the rock shaft between one of spira sores, and an arm that projects from the shaft.
the projecting arm, when the rock shaft is turned up, The projecting arm, when the rock shaft is turned up,
engages with a catch on the end of the car. To the under side of this arm is and into the slot between the arms projects a pin that is
secured to one side of the coupling link that is pivoted on top of drawhesd. The outer end of the arm is at tached to a rod that passes through an eye secured to
the end of the car. Hooks that engage with the oute end of the coupling link are attached to the upper side
of the drawboards. By means of the rods and handles at the end of the carsthey may be coupled or uncoupled either from their top or sides.
Mr. Charles P. Williams
Mr. Charles P. Williams, of Summit Point, W. Va. has patented a new car coupling that is adapted to b
operated from either side of the car. The drawhead of operated from either side of the car. The drawhead of
the car is of the ordinary construction, and has a cross bers that communicate with the interior of the draw bers that communicate with the interior of the draw-
head by means of apertures through which a coupling pin passes. This pin has an arrow head at each end, by means of which a catch engages to withdraw the pin
from the coupling link. The catch is pivoted to the inner end of a rod that projects through the crosshead. This rod has a spring coiled about it which has sufficient
force to hold the catch against the drawhead, and cause the catch which is beveled at the end to be raised through an opening in the top of the crosshead, which back it will engage with the neck of the pin. Underneath the crosshead on each side is fulcrumed a lever
which is used to lift the coupling bar so that it will properly engage to couple the cars. The coupling bar is of the arrow head form.
Mr. James B. Bray,
Mr. James B. Bray, of Waverly, N. Y., has patented
an improvement in car brakes, of that class in which all an improvement in car brakes, of that class in which all
the brakes of the train are applied from the locomo the brakes of the train are applied from the locomo-
tive by means of a steam piston acting upon buffer rods extending the whole length of the cars,'and it con-
sists in running short stiff buffer rods through the sists in running short stiff buffer rods through the
truck sateach end of the car, and connecting these short trucksat each end of the car, and connecting these short
buffer rods directly to the brake beams by springs, then buffer rods directly to the brake beams by springs, then
joining the two inner ends of the short buffer rods to joining the two inner ends of the short buffer rods to
form a continuous connection by means of a traction rod running from truck to truck of the car, which trac
tion rod is at each outer end connected to the ends of the buffer rods through a lever.

## electrical invention.

n invention, by which the loss of power resulting from the rapid reciprocating movement in electro-magized for power is avoided, was recently patented by Mr. John Du Bois Kiely, of Toronto, Canada. An endless belt extends around rollers and through the mag-
nets, and has cylindrical armatures attached to it at regular intervals. The armatures are slightly longer than the distance between the magnets, and the space
between them is equal to twice therr length. The belt rollers are fast on their shafts, one of which carries also a balance wheel. The rollers are flattened on two opposite sides to receive the armatures and to prevent
slipping. Each magnet is provided with a circuit closer slipping. Each magnet is provided with a circuit closer,
consisting of a bell-crank lever, one end of wbich projects into the path of the armature, so that when pressed
down by the advancing armature the lever closes the circuit to the magnet next in advance. This occurs when the armature has passed the point of maximum attraction in one magnet and broken the circuit by its
rear end clearing the lever. The armature belt is moved armatures, thus avoiding changes of direction and uti lizing the momentum.

## MECHANICAL INVENTIONS.

Mr. Rudolf Wittman, of New York city, has patented
n improved device for rapidly and accurately measur an improved device for rapidly and accurately measer-
ing dimensions, such as curved and right lines. The dividers have the usual legs. A circular casing at
tached to the joint piece of the dividers contains a dial tached to the joint piece of the dividers contains a dial
whose circumference is divided into any number of parts. This dial is connected by a train of cogwheels of equal size, with a tracing wheel of the same size and
number of teeth pivoted to a projection of the casing One revolution of this wheel corresponds with one revo lution of the dial. A cogwheel having one tooth more
than the wheels of the train engages with one of these than the wheels of the train engages with one of these
wheels, and is provided with a pointer which passes wheels, and is provided with a pointer which passes
through the center of the dial and revolvesover its face The casing is also provided with a rigid pointer extend ing from the middle of the dial to its edge. To measure a curved or right line, the instrument is inverted and
the tracing wheel is rolled along the line to be measured, the dimension being given by the pointer on the face
of the dial. A new mechanical movement, desigied to convert an
osci llating novement into a rotary movement in a single direction, and to take the place of a ratchet and paw mechanism, has been patented by Mr. James B. Bray,
of Waveriy, N Y. A rotary shaft carries a gear wheel
between two frame plates. A swinging frame is hung
oosely on the shaft and carries a pinion arranged to mesh with the maingear wheel. Uponeach side of the
swinging plate, on fixed bearings in the frame plates, are winging plate, on fixed bearings in the frame plates, are When ats pinion meshes both with he pinion on the frame are locked together, so that when the swinging frame is moved forward it acts as a rigid lever on the shaft to urn it. When the frame is thrown in the opposite
direction the direction of the movement of the shaft is eversed
Mr. Samuel Irwin, of Lindsay, Canada, has patented an improved oarlock, by which the person rowing is enthus facilitating the steering. The handle and blade ections of tbe oar are divided and firmly fixed in sock ets formed with toothed segments at their ends that mesh into each other, and are fulcrumed between two plates which are held firmly together. When the handle
section of the oar is pulled toward the rower the blade section of the oar is pulled toward the rower the blade
section will move in the same direction and propel the bection will move in the same direction and propel the
boarward. To allow the necessary motion to the oar to permit it to enter and leave the water the fulcrum box wase plate of the boat.

## agricultural inventions,

Among recent inventions we find a combined sheep
rack and trough patented by Mr. Amer R. Yost, of rack and trough patented by Mr. Amer R. Yost, of
Somerset, 0 . The base of the rack is of box form, Somerset, 0 . The base of the rack is of box form,
open at tbe top, and provided with four corner posts. To the corner posts of the sides of the box are pivoted the lower bars of racks, adapted to swing toward or the lower bars of racks, adapted to swing toward or
from each other, and the box is covered by a rack bot-
tom that may be revolved to clean out the box tom that may be revolved to clean out the box. To the
end posts of the rack and between their sides is pivoted end posts of the rack and between their sides is pivoted
a swinging end gate that is held from swinging by a pin. By this construction the end racks may be swung up and the rack bottoms removed. To the corver posts
are also pivoted arms the outer ends of which are provided with an angular trough for feeding grain to stock, and the racks when swung upward form a wedge-shaped port for the rack.
Mr. John Feldmier, of Oskaloosa, Kan., has patented a corn planter of the class in which the dropping
mechanism is operated by a knotted wire or rope mechanism is operated by a knotted wire or rope
stretched across the field, and by means of which the rows are properly check-rowed. The machine is supported on two wheels connected by an axle, to which is
attached at the inner sides of the wheels two ransverse bars. To these bars are pivoted side hoppers, connected by a crossbar attached to runners that open channels to receive the seed which passes from the spouts of the hop$y$ a wheel. To the center of the machine is attached tongue, to which are pivoted two parallel bars carrying wheel behind for preparing the soil and covering the wheel behind for preparing the soil and covering the
seed. A three-armed plate is pivoted atits centerto the ross bar, aud to one of its arms is pivoted the seed arm of the lever is pivoted the dropping slide of the arm of the lever is pivoted the dropping slide of the
center hopper, so that the seed will be dropped simultaneously from all the hoppers. The third arm of the rope. means of friction and the blast of air which results from
its passage down a steeply inclined pipe, has been pats passage down a steeply inclined pipe, has been ton Ter. It consists of two or more sceeply inclined ertical changed below each other, and connected by is distributed over a screen which removes the coars refuse and falls upon a fine screen. From this screen it
is discharged into cups attached to a belt, its weight turning the belt cylinders, on each end of which are atchets that jar the screens. When discharged from the cups the grain passes rapidly down untilitis diverted slide. The velocity of the grainh creates a a strongupward slide. The velocity of the grain creates a strongupward
blast, which carries with it all light impurities, while the blast, whic
clean grai
ceiver.
An improved fanning mill has recently been patented
V Mr. Johnathan D. Bush, of Lebanon, Mo. The fan ing mill is of ordinary constraction in the frame, casing, fans, and fau shaft, -with the connecting gear and crank. To the outer end of the fan shaft is attached
a crank, the pin of which passes through a longitudinal slot in a horizontal arm of a right angle lever that is casing lever that passes through the casing and extends across the mill and is pivoted to the opposite side. An arm projects from the forward side of this lever which is slotted at its outer end to receive a pin attached to the cross bar
of tiee upper sieve shoe, and by this construction the pper sieves receive a vibratory motion. 'To the under the lower siever, so that the shoe will be reciprocated by the lower sieves, so that the
the vibration of the lever.
An improved mowing machine has been patented by Mr. Wiliam M. Webber, of Ravenswood, W. Va. The nary construction. A rectangular frame is pivoted to the axle, and to this frame is secured the seat and
tongue, and between its sides is an anxiliary rectangutongue, and between its sides is an anxiliary rectangu-
lar frame that is pivoted at its front end to the axle, lar frame that is pivoted at its front end to the axle,
and its rear end extends beyond the main frame. A cone pulley fixed to tbe axle of the driving wheels, and a similar pulley of less diameter, is journaled in the by a belt. To the end of the small pulley shaft, opposite the pulley, is attached a universal joint. To arms at-
tached to themain and auxiliary frames are hinged corresponding arms of a swinging frame, to which is atached the cutter bar, and in which is journaled a wheel Trovided with a serpentine edge upon its periphery. The shaft of this wheel connects with the pulley sbaft
of the auxiliary frame by the universal joint attached of the ausiliary frame by the universal joint attached
to its pulley shaft. The cutter bar is connected with

## and receivesits motion from

A device by which uniformity in the distribution fine fertilizers is secured has been patented by Mr axle secured to the frame of a seed drill is the seed box and immediately in its rear, and separated by a partition, is the fertilizer box. The seed is removed from the
seed box by a seed-dropping cylinder, and falls into a is the fertilizer box. The seed is removed from the
seed box by a seed-dropping cylinder, and falls into a
tapering spout and passes through the hollow shank tapering spout and passes through the hollow shank
of the hoe to the ground. A mpering conductor spont is fastened to the bottom of the seed and fertilizing boxes. In bearings on the ends of the fertilizer box a shaft revolves, to which are attached as many bevelgear wheels
as there are drills. This shaft is driven from the axle by a belt. Each gear wheel meshes into a bevel gear attached to the upper end of a shaft, the lower end of and attached to it are devices which force the fertilizer
into the bottom of the box, and it falls through the into the bottom of the box, and it falls through the
openings into the conductor spout, and passes with the seed to the ground through the hollowshank of the
Mr. Henry A. Robertson, of Haskins, Kan., has patented a cultivator that is easily controlled and adjusted The axiliary frame; at the rear end of the tongue is a for an cross bar. From the ends of this cross bar braces extend forward and are secured to the tongue, their rear ends being secured to the arch of the axle at its outer
ends. Two inclined bars meet beneath the middle part of the tongue, where they are hinged, and their rea ends extend beyond the axle, and are attached to an arched bar the horizontal end parts of which pass
through keepers on the plow beams. This auxiliary through keepers on the plow beams. This auxiliary
frame is suspended under the main frame by means of over a segmented pulley that is controlled by a latched lever in the reach of the driver, and by which the height of the plows is regulated.

## MISCELLANEOUS INVENTIONS.

Mrs. Loretta Brownlow, of East Paw Paw, Ill., has crushing and straining fruit in making jellies, etc. The device consists of an outer colander made of earthen or botrom, and is straighter in its sides than an ordinary colader, and an inner vessel which is made of the same
shape and material as the outer, and bas numerous small projections formed upon its outer surface to adapt the produce a rubbing effect upon the fruit placed in formed holes to receive the arms of a inner vessel ar besprung into and out of the holes. To the center the spider is attached a crank, by which the inner vessel is turned within the outer to crush the fruit and press it posite sides of the rim of the outer vessessel are formed holes to receive the inward projecting points of spring
arm tongs, that are provided for holding the vessel arm tongs, that are provided for holding the vesse
stationary when in use. A cover which fits into the mouth of the inner vessel adapts it to be used for Mr. Anton Besse., of Vienna, Austria, has patented new apparatus for cleaning grits, grains, etc., thoroughly and in an economical manner. A box is rrovided at its outlet gate of the hopper is opened by the descendin grits, but prevents air from passing back into the hopper. From the lower end of the hopper the grain passes down
through a series of air spaces and inclined plates, and at each space the lighter parts are blown over, leaving the weights pass into different receptacles. The motion of the air which passes through the air spaces is moduced by a suction apparatus that is connected with a channel
Mr. John H. Doyle, of Hillsborough, O., has patented a device for dilating the lips in operations in the mouth without exciting the secretion of saliva or causing pain. It consists of two broad hooks, connected by means of made broad at their outer and clasps. The hooks are made broad at their outer and inner ends, and their
edges converge toward the bend, at which point they are made flaring to accommodate the curve of the mouth are marevent cutting. The inner end of the hook has a slightly concavo-convex surface, and is pro
reflector, which is set in the concave side.
Animproved locking bolt for railroad rails has been patented by Mr. Thomas J. Bush, of Lexington, Ky. Bolts are bent in such a manner as to form short ver
tical necks on long diagonal arms, and the long arm are notched on one side near their lower endis. The nuts. In securing rails with the locking bolts the cross tie is first bored diagonally in such a manner that the holes will intersect each other at the proper depth. their sides intersecting en the holes, the notches on to the bolts and screwed firmly down to the flanges of the rail, the lower ends being securely locked logether
within the cross tie. A sectional impression cup capable of closing
diminish its width, and which can be readily tak diminish its width, and which can be readily tak
apart when desired, has been patented by Mr. James $V$ McMann, of Waverly, Ohio The cup is divided through the center of the handie, forming two sections, one of
which has a lip fitting into a recess in the other, and secured by a screw, and the recess is made large enoug to allow the lip to oscillate slightly therein when the sides of the cup are compressed together. With this conmouth of the patient than cups of ordinary construction. An invention for rapidly and cheaply manufacturing by Mr. Charles W. Dean, of South Wareham, Mass. The nail blank is cut in one piece from a band of pointed without further cutting. As the blanks are de tached they form hook-headed nails with ${ }^{6}$ harp pointed their outer edges are parallel with the inner edge of the y the nail is complete.
a improvement in churns. The body of the churn is cylindrical in form and has a shoulder near its upperend
to receive and support the cover. The cover is made in to receive and support the cover. The cover is made in wo unequal parts, the smaller part being loose. The
larger part is held to its place by buttons that take under cross grooves in the churn body. To this art of the cover is secured a casing that contains an outwardly projecting arm, in which a shaft revolves,
o one end of which is attached a crank; on the other end is a large bevel gear wheel, the lower part of which meshes with a small bevel gear wheel pon a hollow shaft that revolves in a bearing on the
churn cover. In the hollow shaftrevolves another shaft having a small bevel gear that meshes with the gear of the driving shaft. To the lower ends of the hollow and solid shafts are attached cross bars to which are secured paddles. When the churn is filled and the havdle urned the cross bars and their padales move in opposite directions and the cream is rapidly agitated.
An improved shaving mug has been patented by Mr. Peter H. Leonard, of New York city. The invention consists in a shaving mug having a soap compartment provided with a spout projecting from the vertical par-
ition of this compartment. This spout is beveled from the upper edge of the partition, whereby when the cup is slightly inclined the surplus water can flow from the oap compartment into the lower part of the mug.
Mr. John Myers, of Philadelphia, Pa., has patented
an improved wasuboard, the frame of which is of an improved wasmboard, the frame of which is of pieces, which are provided with bearings for pivots of ertical sections. The vertical sections consist of wooden lats covered with corrugated metal, and pivoted at heir ends, upon which they are made to osclllate re strung upon a rubber band, which passes through the openings and is secured to the side frame of the board so as to yieldingly support the slats in one and the lsame plane. The washboard being open on both
ides, and both sides of the sections corrugated, it may used on either side, and will last twice as long as a board that is not reversible.
An improvement in umbrellas, parasols, etc., has been patented by Mr. Joseph Forster, of Vienna, Austria. The umbrella is provided with a support formed of four the plate of the umbrella; the lower ends of the
lower rods are pivoted to each other at the handle, the adjacent ends of the upper andlowerrods being pivoted o each other. To hold the supporting frame when the mbrella is raised the upper rods are united by a brace aving one end pivoted to one of the rods and the other pivoted to a sliding sleeve on the opposite rod, the opened the rods bend outward at their joints ambrella is opened the rods bend outward at their joints and form
an irregular lozenge shaped opening, into which the head and hat of the person carrying the umbrella can pass.
A heater for dwellings that provides pure air and is Mackintosh of Paterson N. J. Around the upper nd lower ends of the heater case are formed flanges, which areperforated to receive bolts that secure the case o receive the ends of air heating tubes that are fitted air and water tight in the plates. In the opposite utlet pipes, through which hot water or steam introduced into the space around the flues to heat the air passing through them. Air to be heated is intro-
duced into the space below the kottom plate through a uced into the space below the bottom plate through a Alue leading from the outside of the building.
An improved clamp for controlling the extension of Gas fixtures has recently been patented by Mr. John F.
Brown, of Brooklyn, N. Y. A circular case, apertured Brown, of Brooklyn, N. Y. A circular case, apertured
for the slide rods, has a screw collar for attachment to the fixture. In this case is an arrangement of disks and springs, and a spirally ribbed rod passing through the ase and through apertures in the disks is checked in its movement by springs of such strength that their friclight.
One of the recently patented novelties is a steam heated sadiron, in vented by Mr. John M. Edmunds, of alt Lake City, Utah Ter. The sadiron is composed of surface of the iron, and an upper chamber connected with the lower by tubes extending almost to the top of the same, so that only steam can escape io the chamber below. This upper chamber has a screw-capped vent for pouring in water, and has also a safety valve. A hollow handle with solid shanks is secured to the top of the upperchamber, and has a vent for admitting oil. A tube provided with a regulating cock is screwed to the han-
dle, and passes down to a lamp in the top of the lower die, and passes down to a lamp in the top of the lower
chamber. 'The wick is ignited and heats the water in he apper chamber, converting it to steam, which passe and heats the same.
A coffee and nut roaster that permits of convenient examination of its contents has been patented by Mr.
Thomas F. McCaffrey, of Philadelphia, Pa. The roaster constructed in two cylindrical sections tbal re hinged oeach other at their open ends. The edge of one section its into the end of the other, and a hasp is provided for Jockingthe sections together. Each section has a series
of apertures for the entrance and exit of air, and a rod projects from their closed ends, on which the cylinder is
rotated. Strips project from the inner surface to stir the contents of the cylinder when it is rotated, so that A light, durable, and inexpensive horse collar, the body of which is made of paper and hollow, has re-
cently been patented by Mr. Christopher G. Cale, of cently been patented by Mr. Christopher G. Cale, of
Albany, N. Y. The body of the collar is made of two ections,which are moulded from papier mache or pape pulp, miixed with some glutinous material. These parts sections that are adapted to be drawn one by one from the ends of the body parts of the collar after the pulp has become fixed. The shells of the collar are stopped with olugs, and to these plugs are secured hinges that unite the parts of the collar at its lower end. To the re adapted to be engaged with and retained by each ther when the upper ends of the collar are brought
