## ENGINEERING INVENTIONS

 A cheap and efficient device for expanding the ends of boiler tubes has been patented by Messrs.Joseph T. \& william H. H. Griscom, of Nashrile, Teni. Rollers reduced in size to form a head at the moved out or in radaially from the central opening, which moved out or in radially from the central opening, which
passes entirely through the expander. The rollers
being inserted in the ube to be expanade, a tapring
mandrel is passed through the central opening of the being inserted in the ubbe to be expanded, a tapering
mandrel is passed through the central opening of the
espander, and is operated by a hand lever for turning the d
ing it.

An ingenious car coupling has been patented by Mr. Leander Kine, of Georgetown, o. The
draw bar and draw head are attached to the car in the unual way. The coupling pin is connected by a pin to a
cievis hinged to the top bar cf a stirrup, and the side bars of the stirrup are hinged near their upper ends to
a rood which works in bearngs on the end of the car body, the stirrup and coupling pin being raised and lowered by turning the rod. The lower ends of the
side bars of the stirrup are pivoted to the inner ends of barswhich arehinged tothe under side of the timber
that support the drawhead. Their outer that support the drawhead. Their outer ends are
beveled and supported on an inclined plate that guides bevelea and supported on an inclined plate that gui
tbe counpling link into the mouth of the drawhead.
A novel car coupling has been patented by Mr. Ferdinano J. Blanke, of Whitewater. Wis. In the drawhead of the car is a ciutch composed of two arms,
having central projections through which an ordinary coupling pin passes, pivoting them and forming the connecting clutch. Between their rear ends is a spring
that throws them apart and closes the front ends. that throws them apart and closes the front ends.
The front end of each arm is in the form of $a$ catch, one arm having a projection that corresponds with an opening in the other. In practice, the clutch is inserted in
one drawhead ana a coupling pin of the usual construction is inserted in the drawhead of the car to be coupled and thecars are closed together, when the front ends of the clutch will be opened by the coupling pin of the carto be coupled, and after the heads pas.
closed by the springs at their ends.
A machine of novel construction for grinding and pulverizing rock has lately been patented by
Mr. Jacob Hause, of Chewsville, Md. The outer faces of the ends of the frame of the machine have bearings forthe shafts of the rolls. There are grooved rolls in
the upper part of the frame for crushing the larger the upper part of the frame for crushing the larger
lumps of stone, and ielow these are rolls with smooth surfaces for pulverizing the material. The shafts of
all the rolls are horizontal. The azes of two crushing and the rolls are horizontal. The azes of two crushing and two pulverizing roils are in the same vertica, plane,
and the azes of one crushing roll and two of the pul-
verizing rollers on one side of the machine are in the verizing rollers on one side of the machine are in the
same vertical plane. Each roll on one side is arranged same vertical plane. . rulls on the opposite side of the
to work againt two
machine, so as to increase the crushing and pulverizing $\underset{\substack{\text { machin } \\ \text { effect. }}}{\substack{\text {. } \\ \hline}}$

## mechanical inventions.

A hinge by which gates or doors are closed automatcally from either direction has been patented
by Mr Ezra Ale. of Altoona. Pa. A plate adapted to be attached to a door frame has two jaws project ing
from its flat surface and beween these is frum its flat surface, and between these is passed a cor-
responding jaw that is attached to the edge of a hinge responding jaw that is attached to the edge of a hinge
plate made tor receive the edge of a alor. A pintle passes
throuh the eaws to form a linge. A tubular casing projects from the rear surf ace of the hinge plate on the
door frame, and contains a spiral spring one end of projects from the rear surface of the thinge plate on the
door frame, and contains a spiral spring. one end of
which rests azainst the hinge plate, and to the other which rests azainst the enge plate, and to the other
endi is attached an ene bolt. To the eeve of the bolt is
Teine secured the ends of chains that pass out through a
transverse slot in the hinge plate and are secured tothe transverse slot in the hinge plate and are secured tothe
sides of the opposing hinge. When the door is moved
either way the spring is compressed. and if the door is either way the epring is com.
released the spring closes it.
Mr. Hiram Mcllroy, of Poplar Ridge, N. Y, has patented an in vention by which the runners
of hob sleighs adapt themselves to an unveren road way. of hob sleighs adapt themselves to an uneven road way.
The sides of the sleighs areseparate and are secured to
the outer ends of tubees, and between the tubes and the the outer ends of tubes, and between the tubes and the
raves of the sleith are bearing blocks, the whole being
connected and held by a clip. The tubes of each bob connected and held by a clip. The tubes of each bob
are held in place by a rod which passes through them and has nuts at each end. This rod aliso passes through lugs on the bolster plate, and is strengthened by braces
that extend from its center to the forward ends of the raves. Tothe rear ends of blocks placed on top of and
at right angles to the bolsters, half elliptic springs are attached at theire centers, while their ends rest on
the rear ends of the raves to hold the sleighs flat to the ground. At the rear sleigh the hox rests on these block at the forward sleigh on a fifth wheel praced on the
blocks.

## agricoltural inventions.

Shears specially adapted for cutting or picking grapes and flowers have been patented oy Mr.
John Sager, of Thamesville. Can. The jaws of the
. shears are made concave on their cuttlnz ed ges, ard
upon the pivot which joins the parts together is placed a finger which extends along and a little below the cutting edge of the lower jaw. This finger has a spring es-
tension along the arm of the jaw and is riveted to it. tension along the arm of the jaw and is riveted to it.
The edge of the finger is made flat, as is also the edge of theopposingblade. The blade with the fllger forms clamping device, by which the gra
being severed, will be firmly held.
A corn planter which insures the planting of the bills at uniform distances, whether the ground is
uneven or level. has been patented by Mr. Alfred A. uneven or level. has been patented by Mr. Alfred A.
McIntosh, of Lincoln, Neb. The frame, channel open.
ing runners, seed bozes. and dropping slides, are of the usual construction. To the ends of an axle are secured
wheels made withe eight spokes, and to the onter ends Wheels made with eight spokes, and to the onter ende
of the spokes are attached crosss-heads to mark the ground, and spikes to revolve the wheels and axie. By
a suitably arranged system of cams and levers, in connection with the wheels and axte. the seed dropping devices placed over the rear of the channel rumners are
operated. The espokes of the wheels are made adjustaincrease the distance between the hills.

An improved sulky caltivator has been pacultivator axile is bent in $\mathbf{U}$ form, and to its center the tongue is attached. The lowerendyof the eaxle are bent to the rearward, so that the cultivator balances on ins wheels, when the plows are raised from the ground.
Tringular frames, resting at their lower ends on the Triangular frames, resting at their lower ends on the ground, are suspended from the azle and tongue by
rods, and regulate tie plows for depth of work. To hese frames the forward parts of the plow beams are rigidly attached, and on the upper side of the frames are crosshead plates, to which auxiliary plow beams are
attached, that may be ad justed laterally. The plow frame may be raised and attached to the rear end of the frame may be raised and attache
tongue to support the plows fron
or passing from place to place.

## miscellaneous inventions.

Mr. Frank T. Knauss, of Scranton, Pa as patented an improved device for attaching the legs of tables to their frames. The rails of the table are
attached to a metalic corner piece by bolts or serews and the leg of the table is secured to the corner piece by a bolt which passes through the corner piece and leg, and receives a thumb nut on its innerend. The leg is slotted in its upper end os as to be slipped upon the
bolt without entirely removing the nut from the bolt. The corner piece will be cast with a lug which enters the slot when the eleg is in place and bolds it steady.
Mr. George P. Cole, of Johnstown, N. Y., tas recently patented an improved manner of attaching sweat pads to horse collars. In the usual method of
securing pads to collars, by stitching through the pad, securing pads to collars, by stitching through the pad,
and the thin web between the rim and the body of the and the thin web between the rim and the body of the
collar,the thread soon rots and leaves the pad loose. The collar, the thread soon rots and leaves the pad loose. The
inventorcords the edge of the pad with wire, and ininvenorcords the edge of the paa win wire, and in-
serts back of the wire, wire staples, which are passed through the thin web of the collar, and clinched at their ends, securing tbem firnnly. The, upper end of the wire
in also passed througn the collar and clinched, and on is alao passed through the collar and clinched, and on
is lower end a loop is formed through which a a taple is its lower end a loop is formed th
passed to secure it to the collar
A simple and effective fire escape has been patented by Mr. Frank P. Fish, of New York city. It is a ladder made of two semi-cylindrical sides, hinged
togetber by suitable roass, and extending from near the tround to the cornice of the building. One of the pieces ground to the cornice of the building. One of the pieces
is secured to the will by staples, and the other is left folding the ladder a small wire cable is attached to the top of the movable side and extends over a pulley, and bas secured to its outer end a counter balance eweight.
The cable is placed so that it may be reached from every story to release the movable ladder, and it is provided with projections that strike the levers of alarm
bells at every story as it is carried up by the fall of the bells at every story as it is carried up by the fall of the
ladder. The ladder is held in position by suitable deladder. The ladder is b
vices when it is closed.
Mr. Henry A. Tobey, of Dayton, O., has solid filth from being thrown into the flue. The bottom olid filth from being thrown into the flue. The bottom
of the register inclines upward from its forward edge, so or the eegister incines upward rom is forwark edge, so
that any fluid throw into in will flow out at the front.
The back of the register is formed of slats, secured to ot side walls, each upper slat being further forward tban the preceding one, and overlap each other at such a distance apart that they may be easily cleaned. With this construction th wiil be inpossibe for ith tho get from
the register to the air flue. The front of the register is the register to the air flue. The front of the register is
closed by a rate, secured by a lock. This register is especially
Mr. Phillip Hufeland, of New York city, the recently patented an elastic metal clasp for holding the covers of an album closed. A bent plate is fastened on the edge of the cover of an album, and to this plate
a rod is pivoted that is provided will two tubular projections open at their outer ends. A $\mathbf{U}$-shaped loop is
surrounded by b coiled spring, and the ends of the spring are passed into the tubular, projections and soldered, forming a bow or loop. When the album is closed the outer end of the loop formed by the spiral spring
drawn outward, and the spring is stretched, permitting it to pass overa headed stud on the opposite cover, and when the spring is released it presses against tbe stud Mr. William H. Hill, of New York city, has patented a combined horse collar and breast band, the breast hand being attached to and extending down from the ends of the collar, so as to fit tightiy against
the a nimal's breast, and is provided at its ends with trace the a nimal's breast, and is provided at itse ends with trace
buckiles and loops, and near its top with terrets for the bucicies and Joops, and near its top with terrets for the
reins. The breast-band is cut in such a manner that it inclines downward slightly from the ends of the collar,
and ftss elos straight band does, and with this device the strain is distributed equally over the collar and the pad.
An improvement in corkscrews has been patented by Mr. Harry L. Perryman, of Lincoln, Neb.
To the middele of the handele is attached a tube that To the midale of the handele is attached a tube that has
longitudinal slots opposite each other. Near the upper end of the shank of the corkscrew are studs fitting in the slots of the tube and guiding it in its reciprocations
on the shank, and also acting as stops in its upward and on the shank, and also acting as stops in its upward and
downward movement. In use the screw is inserted into downward movement. In use the screw is inserted into
the cork and tbe handle pressed dows, when a rapid pull is given to tbe hande, and the tube moves up the
shank until the studs strike the lower end of the slots, shank until the studs strike the lower end of the slots,
imparting a sudden jerk to the screw and cork.
Mr. Elias Edwards, of Remus, Miss., has lately patented an improvement in four wheeled veloci-
pedes. The vehicle has the usual wheels, axles, and springs, and upon the springs there is a crrss bar upon which are placed the ends of curved paralles side piecess
extending beyond the bars and held topether at their forward ends by a crosspiece. In this cross piece, and in that portion of the reach in front of the forward
axxe, is journaled a vertical shaft to which is secured suitable gearing and a lever which reaches back to the rider's knees, for guiding tbe vehicle. The hubs of the
rear wheels have ratchets and pawls secured to them, and rocking levers carry the pawls to propel the veiicle, forward. The vehtcle may be propelled either by the
hands or feetalone, or by both bands and feet By a
peculiar arrangement rods attached to the spolies are ipping of wheels.
A device for cutting button holes of differ ent sizes has recently been patented by Mesers.
Chares C. B. Carton and Heman W. Clapp, both e Caares C. B. Cart.on and heman W. Clapp, both ef
Springfield, Mass. The device consists of a revolvin plate, baving on its periphery a number of cutting blades of different width. and in its center a hole for a pivo upon whin h it revolves between the branches of a
rorked shank, to whicb is attached a suitable hande To the sbank near the hande is secured one end of stud that wo ther end of which is provided with shank, and a sprough hole in a branch or the forked Siank, and a spring catch engages with a series of holes
in the revolving ilate. A lever attached to the shank
no A ladder adapted to be used as an extension or step ladder has been patented by Mr. Winfield
S. Thomas, of East Disfleld, Me. The ladider is of the S. Thomas, of East Disfleld, Me. The ladder is of the
usual construction of side pieces and rounds, and is usual construction of side pieces and rounds, and i
made in two sections, the side pieces converging to point at the top. A spike is inserted in the end of the as brace for the lower section. The top section as brace for the lower section. The top section is
pivoted at it t lower ends to the lower section by a rod on which it turns when shifted from the extension to the step ladder. Notches are made in the upper end sof
the side bars of the bottom section into which a rod that passes drops and forms a locking device when the parts are connected for an extension ladder. To one of the side
bars of the lower section an adjustable extension foo is attached for use upon uneven ground.
An inventiou that provides a means for pro lecting the bristles of hair, bath, and other brushe Yvon, of Brooklyn, N. Y. The stock of the brush has rowsof holes bored in it to receive the bristles, and in oreceive wires by which the bristles are drawn int and fastened in the holes, the wires and thebends of the bristles being below the surface of the back of the
brush. Smail metal bars that fit snugly are pressed into these grooves, after whic
fnished in the usual manner.
A vehicle spring composed of three parts, and made in such a manner as to preserve the elasticit of each, bas been patented by Mr. Lafayette A. Mel-
burn, of Denver. Col. Tbe side bars of a buggy are se burr, of Denver. Col. Tbe sise bars of a buggy are se.
cured to the front bead block, and the rear axle and the ends of tbe spring are secured to them, the body of the the spring. The middle part of the spring correspond in shape to the common half spring. while the two outer parts are constrincted with a cylindirical bearing to form
a joint with the downward curved end of the middel $a$ joint with the downward curved end of the middle
part. From the joint thy yre curved outward in nearly circular form and then inward un
to which they are secured by clip.
An improvement in axles for wagons and otber wheeled vehicles has been patented by Mr.
Robert F. Ives, of Cuthbert. Ga. To the underside of the ends of an axletree are adjustably secured metallic boxes made self-oiling by means of aperures, leading
from their sides to their centers. Spindles are fitted to each of these boxes, that are a little more than donble
the length of the boses, and are of uniform size and diameter throughout except at their center, which it formed with a collar, and their edds, which are re duced to reecive nuts The nuts on the outer ends of
the spindles hoold the wheels fast. The nuts on the boxes. By this construction the wheels are stronge and the spindles will not wear flat, and the boxes ar ways accessible and self-oiling.
Improvements in farm gates that move cords, have bee patented by Mr. William C. Hooker of Abingdon, Ill. The gate is of the ordinary con-
struction, the top bar being extended to the rearward, struction, the top bar being extended to the rearward, and beneath it a parallel bar is placed, the two being
connected at their rear ends by a crosss bar. The gate moves back and forth between posts, to which, upon both sides of the gate, are attached bars corresponding with
the extension bars of the gate. Two flanged rollers are placed loosely between tbe bars of the gate and tize corresponding bars, and are journaled in the forked ends of end of the track bars are double inclined projections and upon the lower edges of upper bars are correspond ing recesses. When the cord attached to the gate is
pulled the gate is drawn back, the double incline and the mome
Mr. David W. Smith, of Port Townsend, W.1., has recently patented a flre and water proof safe
hat will float from the vessel should the vessel sink that will float from the vessel should the vessel sink
The inner safe for containing valuables is rectargular in form, and is made burglar proof. Fastenings a re buoyancy to float the safe is attached, and the doo has a water-tight packing The bnoyant jacket has a
door opposite the door of the safe, that is secured when door oprosite the door of the safe, that is secured when
closed by any ordinary device. The safe is placed in an ron box on the deck of the vessel, and should the vessel ink it would float out of the box and not be carried
own. A sheet metal buoy extends above he safe, and is painted with bright colors, desig
ion when the safe is in the water.
Improvements in car axles and wheels have Worth. Tex. The inventor provides each en, of For axle with a axed ratch twheel, and the car wheels with spring pawls that engage with the ratchets. The car
wheels are placed loosely upon the axle, and when rounding curves thewheel upon the outside of the curve
will not be retarded by the slower motion of the inner wheel, the ratchet and pawl mechanism permitting the speed of the wbeel on the outside of the curve When the car is running in a straight line the wheels and axle ter the same as the usual construction.
An improvement in water tuveres has been
patented by Mr. Frederick Bowen, of Barmhart's Mills,

Pa. The tuyere consists of two pipes coiled parallel to pipes at one stle of the tuyere and is discharged at the other. The tuyere is made tapering toward tbe front
end; the pipes are arranged close together, and the rear end; the pipes are arranged close together, and the rear end is surrounded by a band whtch holds the pipes
together. With this coostruciou the water passes together. With this construciou the water passes
through a sborter length of pipe, which is cooled much through a sborter length of pipe, which is cooled much
better, depositing less sediment, avoiding one of the causes of the destruction of the pipes. Mr. Juljus Leede, of Washington, D. C., operated sofely by the buoyancy of the water. The meteris placed at the higbest point in the $f$.ilding where water is to be distributed, and the servicc sipe is carried
irectly up to it and connects with the primary distributing chamber. Two measuring chamoers, into which the water flows from the distributing chamber, are formed dividing the main portion of the meter casing by a vertical partition, which also serves as a support and suide for all the movable Parts of the meter except the
loats. Each of these chambers contains a foat attached 0 an oscillating lever that operates the valves and regstering mechanisms. Below the meter casing and atached toit is a governing cylinder containing a float, whose action controls the induction of water into the
istributing chamber. When the discbarge of water om the governing cylinder is arres ed the accumulation of water in this cylinder will cause tbe float to rise and off the supply to the measuring cylinders.
An inprovement in traction engines that adapts them to passing over uneven earth roads has
been patented by Mr. Abraham O. Frick, of Waynesboro, Pa . The engine has two traction wheels, one bose on the axle and the other rigidly connected to it.
The countershaft receives its motion from a pinion on the crankshaft, and the outer end is so constructed as ertically, and is angles to the means or compensating ear to transmit motion to either one or both of the raction wheels, and enabling them to have an inde-
pendent motion in turning. The compensating gear pendent motion in turning. The compensating gear
wheel has a laterally flexible rim of teetl that serves to heel has a laterally flexible rim of teeth that serves to
compensate for variations caused from the pitching of e engine from side to side.
An improved automatic car coupling has recently been patented by Mr. Carl G. A. Alexander, of
Aldin, Iowa. The drawhead of the car has the usual Adin, lowa. The drawhead of the car has the usual
entral opening. The inner end of a coupling hook is pivoted in the bottom of the opening by a pin, the
hooked end projecting beyond the drawhead to engage ooked end projecting beyond the drawhead to engage On the rear face of the hook is a horizontal rack bar, he teeth of which engage with a pinion that is fast on the end of a vertical shaft revolving in an opening
in the drawhead, and extends to the top of the car, where is provided with a hand wheel, and a ratchet wheel to move the conpling bar inwardly. Wheng that tends run together the ends of the hooks pass over the coupling pins and are coupled, and to uncouple, the hand
wheel at top of the car is turned and the hook drawn acel at top of the car is turned and
A novel device for raising objects from the ground to a wagon has been patented by Mr. Adam
Borns, of Grand Rapids, Mich. Two rack standards cured in a base frame are provided on their edges with upwardly projecting teeth and united at the top by a with pawls that engage with the racks, and also with guide bozes sliding on each of the rack standards and from the top of the guide boxes, ropes pass over pulleys at tbe tops of the standards, having attached to their outer ends weights a little heavier than the weight
of the platform. 'The pawls are provided with arms hat hoid them in their place, and a rope secured below the platform releases the pawls. An object to be raised
is placed on the platform, when the platform is rocked is placed on the platform, when tbe platform is rocked
from one side to the other, the pawls engaging with the

Mr. Henry M. Loud, of Oscoda, Mich., as patented a novel device for feering and turning logs aving stop projections, which prevent them from rolling on the saw carrlage. Just below these projections is horizontal shaftprovided with arms that lift the lowst $\log$ over the projection and on to the carriage, when
we when necessary a cont bar is provided that is operated by a chain and pulley from the shaftthatfurnishes power for the log lifting device. These devices are controlled by a lever so placed that when it is thrown in one direc-
tionit operates the log lifting devices, and thrown in the oposite direction it operates the log turning device.
A device by which the handle of a pump may be easily changed from one side to another has
been patented by Mr. James Preston, of New York city. The pump cylinder is held to a frame provided with U-shaped band that passes around the cylinder nder a collar on its surface, and is bolted at its
nds to the frame. The cylinder is thus free to turn on its axis, so that the spout can project in any desired irection. A connecting rod is pivoted at its lower end the pump handle near the upper end. The upper end f the haudle is pivoted to the piston rod. If the pump detached from the handle and the handle is turned to the other side
An improved platform elevator has been patented by Mr. Thomas Keith, of New York city jatform. A rocking platform having a double irclined loor is pivoted to the side frames, and is provided with a latch piece and spring to hold it in position to receive freight, and a lever to move it from one position
to another. Tripping dogs come in contact with the another. Tripping dogs come in contact with the
and when the elevator reaches the floor for which they are set, and the platform is pressed down and the freight
discharged. Suitable devices are provided for discharged. Suitable devices are provided for starting
