Pbis places a great restraint on his direct testimony, and with the exception of the center, which is white. enables the opposing counsel to test the validity of his views. There is no way by which the worm-pest can be got by cross-examination.

the case. It is to have experts called by the court directly, Undoubtedly the best way yet devised is to brush off and and paid by it to assist it in its deliberations. At present ex- j destroy the nests of the moth. Generally they are easily perts are to all intents and purposes assisting counsel. This seeu, and when it is remembered that each one contains would make them assisting judges. The idea of thus using more than two hundred eggs, it is easy to conjecture what them is quite a popular one. Many of our best lawyers ad- an inroad one man could make in the ranks of the catervocate it. The expert would occupy a wholly disinter- pillar. ested position, and the decisions he reached would have every chance of being equitable and just. In this suggestion there is much that is attractive, and in a more advanced state of society it would seem worthy of being carried out.

But the same necessity which calls for advocates and lawyers to argue separately each his own side of a case calls also for experts on the separate parts of complainant and de-

before a court and accept its unaided judgment as infallible. Each side engages its own counsel. These are officers of the sketching as explanation can get enough facility by practice court, yet are not prohibited by that fact from taking one to make themselves understood readily. side or the other of a case. Their duty is to do so, and Probably nothing is more difficult to explain and exhibit be as one-sided as possible, and to carry every possible point i by words alone than mechanical construction and mechaniin their client's favor. No matter how able the judge may be, his time is too important to be devoted to looking up also for the listener. The memory must bold all the points authorities and to studying each from the books. He sits in of the information in contact ready to make a completed judgment upon the views presented him by counsel. If idea at the climax. But an appeal to the eye, however they are properly put forward, he in many cases can decide crudely made, presents the entire image at one view without pressing the earth tight against them with the foot. This the case without leaving his seat. Thus business is experiany laborious action of the mind. And it is a noticeable work is usually intrusted to half grown boys and girls, a dited, and the main expenses of a suit are borne by the interested parties and not by the government.

suits, and were the parties in the suit to have none, the position would be analogous to that of a court sitting in direct representation they seek to impart their knowledge to judgment or arbitration, with no lawyers to advocate the others. causes of those appearing before it. There would be no : summary of the scientific questions presented. This work ment is an excellent one for mechanics generally to acquire. would fall upon the court and its expert. Business would If one bas not the natural impulse in this direction, a few be delayed, and a very considerable expense he placed upon lessons in free hand drawing will not be amiss. Some of the court. It would not be much better to dispense with the best of James Watt's improvements derive their historiexperts than to dispense with counsel.

At present the scientific views are well presented. The experts give them in detail. They are formulated after discussion with their counsel. The counsels in their briefs the annual meetings of mechanical engineers there is seldom and arguments summarize them, and present to the court a paper read that is not illustrated by the author, at the pay satisfactorily if applied to choice varieties in small their most salient and applicable points. The expert has time of reading, by the blackboard and chalk, or else it had quantities, about to be used for seed. It is certainly better been debarred by his position of witness from arguing the been made visible by prepared cartoons, or possibly lithocase. Any tendency he may exhibit in his testimony toward such a course is met by objection from the opposing counsel. at sketching. There are many jobs which do not require - state cially qualified witness. The counsel completes the work are greatly expedited if the foreman has a facility with the expert has begun. He can give the fullest license to his pencil, crayon, or chalk. reasoning powers in proving his case. The argument is the supplement of the expert's testimony, and has therefore to follow it very closely. A departure from any of the views brought forward by the expert will be made to tell forcibly against the same side.

Thus it will be seen that the lawyer and expert must work hand in hand. One cannot go ahead without the other, the witness being the most restricted on account of his position. While his testimony must bear the stamp of independence, it will necessarily be partial. As this partiality is known and recognized as an attribute of expert testimony, it gives the professors of it a known standing. They are considered fiber saturated with benzine, and even lucifer matches. The with justness as specially educated witnesses retained for the purpose of presenting the views of one side to the court. They should not be considered as sailing under the false colors of a pretended disinterestedness.

THE CATERPILLAR AND ITS ENEMY.

The ordinary caterpillar is covered with bright yellow hair, has a deep brown stripe down the back, has four tussocks, or tufts, of hair in a row back of its head, and has two small red warts on the two segments next the last. From the extremity projects a single pencil of hairs, and blast from the revolving beater. It is probable that partifrom the head radiate two pencils having the appearance of borns. The eggs from which the caterpillar, or grub, is hatched are small, white, and hard.

When the grub emerges it commences to feed, bending all its energies toward gorging itself. It grows rapidly,

rid of, and although this fly aids in the work of destruction, There is yet another way of disposing of the difficulties of his numbers are too small to make his efforts appreciable.

SKETCHING FOR MECHANICS.

While the value of a knowledge of mechanical draughting to a mechanic is indisputable, there is a sort of free hand drawing, or sketching, that is also useful. The faculty for its practice may be innate, and in that case but slight instruction is necessary to enable its possessor to illustrate his thought far better than he could impart it verbally. But even those whose natural tendency does not impel them to

cal movement. It is not only difficult for the narrator, but fact that those mechanics who are of an inventive, improving, and originating turn of mind are most apt with pencil Were the court to call an expert for its guidance in special and paper, or chalk and slab. PICKER FIRES

A writer in the Textile Record for July asserts that a fire cannot be started in a picker house by sparks of fire from the picker igniting the cotton; "no spark from a picker ever fired a mill or ever can be made to set fire to anything." As the writer well says, "these are tolerably broad assertions." Nevertheless, he offers as evidence in favor of their truth the result of experiments which he made, such as producing a shower of sparks from a brick held against the beater, into which was thrust successively sboddy, cotton open hand held against the stream of sparks felt no pain.

The sparks from an emery wheel do not burn the hand, nor ignite the workman's apronor overalls, but each particle is a minute coal of fire, and under favoring circumstances will ignite inflammable and explosive materials. Sparks from a flint and old file will ignite tinder, charred rags, and punk. But to do so the sparks must be protected from the wind. Possibly the experiments made by the correspondent were made with the beater box uncovered, and the lint and other materials and the shower of sparks were exposed to the cles of grit, nails, bits of wire, and similar materials do run the gauntlet of the picker beaters frequently without inciting a blaze, as the condition of the waste proves; but there may come a time when, all the conditions being favorable, the destructive spark will do the work.

shedding its skin several times, and when full sized, or full The writer attributes fires to the spontaneous combustion fed, as it is termed, is ready to spin its cocoon and enter the of oily waste which is put into the picker house. Mill owners show The females are wingless, having only rudimentary wings, and do not travel any distance. The males are smoke coltheir belief in the danger from this source in erecting detached fire proof buildings for picker houses, and it is ored with spotted wings. The female lays about 230 eggs, covering them with gluten and a silk which she spins, so doubtful if a single mill owner could be found so confident that the nest has the appearance of a little tuft of white in this correspondent's belief as to allow experiments be made cotton. She sometimes draws leaves around the nest so as in bis picker house by passing through the rolls to the beater nails, wire, or grit with the cotton. At all events, to completely close it, excluding the rain and deceiving the eves of the birds. no degree of the vigilant caution now practiced to prevent

How to Raise Big Crops.

It has often been asserted by advanced agriculturists that if wheat, either spring or winter, is sown in drills, far enough apart to admit of using a horse hoe between the rows, both to keep down weeds and loosen and aerate the soil, the yield might be increased to a marvelous extent more than it now is in this country.

In proof of this, a recent observing and intelligent traveler in Belgium gives the mode of culture there and the yield, which sometimes, with very favorable weather for barvest, reaches as high as 160 bushels per acre. This is one of the most fertile, prosperous, and most populous countries in the world, supporting 481.71 persons to the square mile, against 13.92 in the United States and 216.62 in Germany. Winter wheat is a staple crop there on their high priced small farms of only an acre or two. The land is highly manuted in Autumn, well harrowed several times, and got into the best possible condition. The grain is sown in the fall in seed beds, very thickly on the highest and best location, where it is not likely to be winter-killed, or injured by any casualty, such as overflowing or drowning out, or smothering under the snow.

In the spring the main fields are again dressed up and marked out in drills the proper distance. When the wheat has grown sufficiently to be moved, it is thinned out by being taken up, separated from the thick stools, and planted in the drills with a tool called a dibble, which makes a hole the proper depth, into which the wheat roots are inserted, man sorting out the wheat plants in order that those of the same size may be placed together, that the field may grow

When the plants have commenced growing, the soil is thoroughly and constantly stirred, either by means of hand or horse power. Every weed and all foreign plants are destroyed, and nothing but what is wanted, the article itself, is allowed to grow. There are very seldom any extensive failures of crops thus carefully and scientifically grown. The yield is a quantity never imagined or heard of in this country, and the crop always and surely pays the cultivator.

It is asserted that such pains would not pay to apply to crops in this country. But do we not go to the opposite extreme? Has it ever been tried here? It certainly would to till one acre and get a crop now raised on four acres, than to try the four and only raise half a crop, which is now so often the case here.-Milling World.

The Water Jet.

The Annales des Travaux Publics describes the method used in sinking the piles for the foundation of the Palais de Justice at Brunswick (Prussia).

A framework with hoisting fall somewhat similar to the ordinary pile driver was used in placing the pile in position ready for sinking; two tubes, each 2 inches in diameter, with the lower ends bent inward toward the point of the piles, were attached to the piles by iron staples; at the upper end each pipe was connected by a short section of rubber hose to other pipes connected with the city water main. which water supply was in this case under a pressure of four atmospheres. The piles usually sunk by their own weight into the hole formed by the water jet, as soon as the valve was opened, making connection between the tubes on the pile and the water main. To hasten the rate of settlement, a vertical iron bar 3 feet long was set into a hole bored in the head of the pile, and upon this were placed iron weights of 200 pounds each, as the resistance might require.

Piles 12 inches in diameter were sunk in this way to a deptb of fifteen feet in 10 minutes' time. The least time required for a deptb of 15 feet was 2 minutes, the longest time for the same depth was 30 minutes. As long as the water jet was in operation at the foot of the pile it was possible to give the pile rotary motion, and thus facilitate the descent; but as soon as the jet was stopped the pile became immovable. As a proof of their stability a dead weight of 50 tons was applied to some of them, and it was found that their resistance was entirely independent of the time consumed in sinking them.

To sink 20 piles by this method required the use of about 2,000 gallons of water; 7 or 8 laborers were employed, and

The ichneumon fly is a parasite, its prey being the caterthese foreign substances from reaching the picker should be pillar above described. egg is hatched the grub works its way down into the pura, on ; An artesian well sunk by the Pierce Well Excavator Comwhich it feeds. When full fed it spins its cocoon in which it completes its transformation, coming forth as a fly. The pany for the Manhattan Elevated Railway Company, at annually. For building purposes it is not well adapted, as fly is slim bodied, about one-half an inch long, and of a 128th Street corner 2d Avenue, in this city, has a depth of it is apt to swell and shrink with the condition of the atmoblack color. In some species the antennæ and legs are red, 250 feet, and yields 250 gallons of water per minute,

one gang put down from 6 to 14 piles per day.

Copper for Roofing.

In speaking of the cost of building materials an architect recently suggested the use of copper instead of galvanized iron or "terne" sheets for roofing purposes. He said that copper costs only about double the price of tin, or iron, for the same area of roof, that it is practically indestructible by time, and that even if the building it covers is pulled down the roofing material possesses an absolute value. The price of copper has seriously declined within the past year, and if the supply continues to augment much more, the metal will soon be as cheap as tin.

COTTON WOOD lumber seems to be coming into large use, and for dry goods cases, starch boxes, and similar purposes it is said to be well adapted. One establishment in Obio, it is said, works into boxes as many as two million feet of lumber aphere,
