Scientisic American.

ESTABLISHED 1845.

·MUNN & CO., Editors and Proprietors. PUBLISHED WEEKLY AT

No. 361 BROADWAY, NEW YORK.

O. D. MUNN.

A. E. BEACH.

TERMS FOR THE SCIENTIFIC AMERICAN.

One copy, six months postage included

Cinbs.-One extra copy of The Scientific American will be supplied gratis for every club of five subscribers at \$3.20 each; additional copies at same proportionate rate. Postage prepaid.

Remit by postal order. Address

MUNN & CO., 361 Broadway, corner of Franklin street, New York.

The Scientific American Supplement

is a distinct paper from the SCIENTIFIC AMERICAN. THE SUPPLEMENT is issued weekly. Every number contains 16 octavo pages, uniform in size with SCIENTIFIC AMERICAN. Terms of subscription for SUPPLEMENT, \$5.00 a year, postage paid, to subscribers. Single copies, 19 cents. Sold by all news dealers throughout the country.

Combined Rates. - The Scientific American and Supplement will be sent for one year postage free. on receipt of seven dollars. Both papers to one address or different addresses as desired.

The safest way to remit is by draft, postal order, or registered letter Address MUNN & CO., 361 Broadway, corner of Franklin street, New York.

Scientific American Export Edition.

The SCIENTIFIC AMERICAN Export Edition is a large and splended periodical, issued once a month. Each number contains about one hundred large quarto pages, profusely illustrated, embracing: (1.) Most of the plates and pages of the four preceding weekly issues of the SCIENTIFIC AMERICAN, with its splendid engravings and valuable information: (2.) Commercial, trade, and manufacturing announcements of leading house Terms for Export Edition, \$5.00 a year, sent prepaid to any part of the world. Single copies 50 cents. ** Manufacturers and others who desire to secure foreign trade may have large, and handsomely displayed announcements published in this edition at a very moderate cost.

The SCIENTIFIC AMERICAN Export Edition has a large guaranteed circu

lation in all commercial places throughout the world. Address MUNN & CO., 361 Broadway, corner of Franklin street, New York

NEW YORK, SATURDAY, MAY 17; 1884.

REMOVAL.

The Scientific American Office is now located at 361 Broadway, cor. Franklin St.

Contents.

(Illustrated articles are marked with an asterisk.)

Animal remains in coal 313	Machines, spinning, collecting
Bees, how to handle 312	and removing waste from 306
Blindness, color, suggestion 308	Meteorite, fall of a 306
Business and personal 314	Monsters, sea, unmasked 309
Chrysanthemums, stimulants for 311	Motor, sun, Ericsson's* 310
Cincinnati, health of	New books and publications 314
Corn, green, for pigs 312	Notes and queries 315 Paint and varnish works of F.W.
Congh remedy, 8 304	Paint and varnish works of F.W.
Couplings, car, victims of 307 Criminals characteristics of 313	Devoe & Co.*303, 308
Criminals, characteristics of 313	Parasites, dangerous, two 311
Diarrhœa, hot lemonade for 310	Parasites of money 304
Discoveries, remarkable* 311	Patentbill, stenographic, a 305
Doctor, dist., incidents in life 305	Patent question, the 305
Engine, gas, new*	Plane, bench, Curtis'* 307
Evergreens 305	Plant, house, beautiful* 310
Eye troubles, elevated R.R. cause 304	Pine, screw, the, at home* 310
Fountain attach. for brushes* 312	Rags, Egyptian, disinfection of. 304
Girls, electric 312	Revolver, photo., for amateurs*, 307
Gun, heavy, casting of a 905	Shop, little, the 304
Hen, a sheet iron	Silverware, to photograph 312
Hickory 312	Sleepers, railway, suggestion as to 309
Industries, American 308	Sugar, sorghum
Inventions agricultural 314	Sumae 318
Inventions Anginopring 314	Sumac
I wentions index of	Tombstone, Miller's*
Inventions machanical 314	Trees, height of, measuring 306
Inventions toleralleneous 214	Truck, car, McConnell's* 306
Inventors trunc for 906	Turning and grinding 309
folios malled of terms 200	Wetch made to be nounded 910
Lakes, wailed, of lowa 505	Watch made to be pounded 312
Latne, Blanchard, the 304	Wells, digging
LOCK, new, Mikesell's*	Wrench, improved, De Silva's* 306
Locust, seventeen year, the 313	Yucatan, discoveries in* 311

TABLE OF CONTENTS OF

THE SCIENTIFIC AMERICAN SUPPLEMENT

No. 487.

For the Week ending May 17, 1884.

Price 10 cents. For sale by all newsdealers

- PAGE I. ENGINEERING AND MECHANICS.—Bange's Artillery System.— . 6967 wheels, and formulæ or equations for the same.-With 13 figures.. 6968 Single Spindle Profiling Machine.—With engraving...... Submarine Explorations.—Apparatus used on the Talisman for depths.-Electric light in the sea. different. Effect of the pressure of the water at great depths.-Deep sea and
- II. TECHNOLOGY.-Notes on Pharmaceutical Apparatus.-Paper read by CHAS. SYMES at a meeting of the Liverpool Chemists' As-
- III. ELECTRICITY.—The Play of the Needle.—With 1 figure...... 6973

the telegraph.—Description of Morse's different apparatus.—With five engravings and diagram showing specimen of writing of

- IV. ASTRONOMY.-Prof. HEYER on Comets.-A letter to the Editor, 697?
- V. PHYSIOLOGY, ETC.—The Six Gateways of Knowledge.—By Prof. Sir WM. THOMSON.-Treating of the senses, manner in which they
- VI. MISCELLANEOUS How to Make, an Incubator. Directions. -

ELEVATED CITY RAILWAYS CAUSE EYE TROUBLES.

The introduction of the elevated railways in this city has also brought in a peculiar class of optical troubles, due to the lodgment of iron dust in the eyes of pedestrians and others who have occasion to travel or pass under the railway structures. Hundreds of such cases are now treated at the hospitals, and most of them are successfully cured, the particles being removed by a gouge-shaped instrument about the size of a sewing needle. The pieces are too firmly held to be removed by magnets.

The trains have a high speed between stations, and are quickly brought to a stop. This requires strong braking, which grinds off the iron from the shoes in fine showers. and the iron particles fly in all directions.

A magnet applied by us to the tops of the crossties attracted a large quantity of very fine iron dust. Each passing train deposits its quota of iron, not only on the cross ties, but upon the street below. We passed a magnet along the gutter of the street near the stations, where dust usually accumulates, with the result that large quantities of iron particles were secured upon the magnet. The same experiment was also tried in Broadway, through which no elevated railroadruns, and while iron particles were attracted, the quantity was far less than at the railways. By passing the magnet along a distance of only six feet near a railway station, more iron was attracted than by passing it along an entire block

These particles varied in size from one-sixteenth of an inch to dust so fine as hardly to be distinguished by the naked eye, and were frequently entirely invisible, requiring the aid of the microscope to reveal them. Viewed under the microscope, their dangerous character becomes apparent. The greater part were bordered by a jagged fringe with very fine points, compared with which the point of a cambric needle appeared dull. Not infrequently the projections were hook-shaped and barbed similar to a fish hook, which will account for the difficulty experienced in removing them from the eye, into which they have been driven—the closing of the eyelid and the rubbing which thoughtlessly followed, assisting to more firmly embed them in the cornea.

In order to determine whether iron particles could be attracted while floating in the air, a magnet exposing about one square foot of surface was suspended in mid air under one of the railroad tracks, and although the magnet was by no means a strong one, it attracted to itself iron particles in spite of a strong wind which blew at the time.

Further, the awnings of shop keepers along the lines of the elevated railroad are discolored by iron rust in a very short time, and require frequent renewals, since washing fails to remove the stains which the rust produces.

The evil above described being manifest, the question of its prevention naturally suggests itself. The subject is worthy the attention of inventors.

THE LITTLE SHOP.

It is time that notice should be taken of the work done as well as of the place taken by our small shops. The "big concerns" do not monopolize all the skill and mechanical capability in the country. They may profess to do the best work and produce the best results, because they are furnished with the best tools. But they do not monopolize all the mechanical skill, nor collect all the best workmen. Many of the best manipulators, and a very large proportion of the most exact mechanics, are in the little shops; content, may be, to be the foremen, when in a big shop they would be only first class workmen. The small shop men are valuable in any shop where mechanics, rather than operatives, are required, because they are generally "men at a pinch," "expediency men," and generally excellent work-

The proprietor of a large manufacturing establishment, building fine tools of a particular character, claims that his best men come from small shops where makeshifts and contrivances are the rule. "Such men," he says, "can make the shop hum" by their methods.

It is very convenient to have a shop full of adapted tools, but it is also convenient to have in the shop graduates from "the little shop" who can contrive as well as tend a machine.

The Blanchard Lathe.

The "last lathe" of Thomas Blanchard is an invention that proves itself worthy the name in perpetuity instead of many other articles, could not be turned as a whole in the but invariably recovered upon its use. lathe.

A few changes have been made in the Blanchard lathe within the last twenty years, but these were mainly adaptations of well known mechanical movements for the special work to which the particular lathe was assigned. The writer well remembers Mr. Blanchard, thirty years ago, and success in his new field of labor, and we congratulate the in conversation he then stated that of all his inventions that of his "last lathe," as he called it, was one that required no of so valuable a coworker.

radical change. Yet he would be surprised to see one of his machines turning out from 600 to 700 carriage wheel spokes every ten hours, made from the toughest hickory, and not only that, but changing its feed automatically to suit the work. This change is quite ingenious. There are two feeds to the longitudinal progress of the cutter head along the machine, and where the sawed spokes are small and the amount of material to be removed is little, the feed is very rapid; but as the cutter head approaches the hub end of the spoke the curve makes the material to be removed more, because the spokes as sawed present only straight lines from end to end. The feeds are by pulleys and belts, and when the time comes for changing the movement of the cutter head, it releases a lever and holds another, each carrying idler pulleys, so that the fast or swift feed pulley is released and the slower pulley takes its place. The work is so nearly automatic that the attendant has only to take out the turned spoke and put in a sawed blank; but at the rate of over one a minute his place is no sinecure.

Disinfection of Egyptian Rags.

In relation to the proper disinfection of rags imported into the United States from Egypt, the State Department has, upon careful and mature consideration of the subject commensurate with the interests involved, decided upon the following methods of disinfection, either of which will be satisfactory to the health authorities of New York city, New Haven, and Boston, who have been consulted in respect to the matter, viz.:

- 1. Boiling in water for two hours under a pressure of 50 pounds per square inch:
- 2. Boiling in water for four hours without pressure; and
- 3. Subjection to the action of confined sulphurous acid gas for six hours, burning 1½ to 2 pounds of roll brimstone in each 1,000 cubic feet of space, with the rags well scattered upon racks.

Full and explicit instructions have accordingly been given to Mr. George P. Pomeroy, Agent and Consul General at Cairo, and Mr. Francis McNally, a citizen of the United States, has been designated as the Inspector. He will have immediate supervision, under the Consul-General, of the process of disinfection, will be required to give the subject his earnest personal attention, and furnish a proper certificate. Mr. McNally's certificate will show the following facts: The name of the consignee in the United States, the place where the rags were disinfected, and the process of disinfection, which must be one of the processes hereinbefore described.

After that the Consul-General is to authenticate the certificate given by the Inspector. This process is to be observed in the case of every bale of rags, which is to be also marked "Thoroughly inspected," with the name of the inspector.

The Parasites of Money.

The Frankfurter Zeitung states that Dr. Reinsch bas found, as the result of a long series of minute investigations, that the surfaces of 50-pfennig pieces (sixpences) which have been long in circulation are the home and feeding ground of a minute kind of bacteria and vegetable fungus. An extended series of observations showed that this is the case with the small coins of all nations, the thin incrustation of organic matter deposited upon their surfaces in the course of long circulation rendering them very suitable for this parasitical settlement. Dr. Reinsch scraped off some of these incrustations, and with a small scalpel divided them into fragments, which were subsequently dissolved in distilled water. The employment of lenses of very high power showed the bacteria and fungi distinctly. This is a matter of no little importance from a hygienic point of view. It has now been conclusively established that bacteria form the chief agency in the propagation of epidemic disease. The revelation that they have a chosen domicile in the most widely circulating medium which probably exists in the world presents us with a new factor in the spread of infectious disease. There is, however, a remedy. Where coins have been in circulation for a number of years, if they are washed in a boiling weak solution of caustic potash they will be cleansed from their organic incrustation, and so freed from the unwelcome guests which they harbored.

A Cough Remedy.

One of our English contemporaries, in reply to an inquirer, being confined to the turning of wooden lasts. This inven-recommends a sirup made of the following ingredients for tion was made public more than sixty-three years ago-Janu-colds and coughs: Take 18 ounces of perfectly sound onions, ary, 1820—and was afterward adapted to wheel spokes, hat and after removing rind make several incisions, but not too blocks, wig blocks, and a large number of other irregular deep. Boil together with 131/2 ounces of moist sugar and forms. Although Mr. Blanchard made many improvements 234 ounces of honey in 35 ounces of water, for three-quarters on his original device, the main design is retained in the of an hour; strain, and fill into bottles for use. Give one latest adaptations—that of guiding a rapidly revolving and tablespoonful of this mixture (slightly warmed) immediately longitudinally feeding cutter head by a model. Except for on attack, and then, according to requirement, five to eight exact corners, there is hardly any simple form that cannot be half tablespoonfuls daily. It is said that this recipe was reproduced by the Blanchard method; of course, a product hat used by the Zulu Caffres when visiting Europe some tion with a body and members, as a statuette, or a vase, or two years since, and who suffered much from the climate,

> ORANGE J DD, who has ably managed and edited the American Agriculturist for thirty years, has retired from the latter paper and removed to Chicago, where he is employed as editor of the Prairie Farmer. We wish Mr. Judd great Prairie Farmer on its good fortune in procuring the services
