zinc are better than one carbon and one zinc; one- Journal of Society of Arts, vol. xxxi., pages 380-96. fourth of an inch is a good thickness for each. 4. How is the length of a spark of an induction coil measured? A. The length of a spark of an induction coil is the distance between the points from which the discharge takes place.

- (42) J. H. asks if a building roofed with one built of wood. A. An iron roofed building is no more likely to be struck than one of wood. The iron roofed building is the safer if struck; especially so if the roof is well connected with the earth by rods.
- carried into a house by a copper wire soldered to a copper lightning rod a few feet above ground, so as to form a ground connection for the telephone described in Supplement, No 142? A. If the ground to your lightning rod is insufficient, the lightning would probably follow the wire into the house, provided it could find better ground thatway. 2. Would an acoustic teleconductor for the acoustic telephone.
- (44) J. W. B. writes: Suppose an endless iron chain should be revolved through a longitudinal helix, charged with electricity from a galvanic battery, would I meet with as much resistance in revolving the chain either way as I would in extracting a straight bar magnet suspended within the same helix? A. The resistance will be less than that of the magnet, but it would still be considerable.
- (45) J. M. K.-We do not recognize the kalamein process. If you refer to carbonizing the surface of iron, we think it compares favorably with gal-
- (46) H. E.—Electric light carbons will an swer for telephone transmitters. The French is the best. Polish the carbons by rubbing them on the finest French emery paper.
- (47) J. R. F. asks how he can find the prices for which some of the principal American patents on dynamo electric machines and arc lamp regulators have been sold. A. We know of no means of getting at the prices of dynamo patents. The sum mentioned in the assignments is generally nominal. The real price is a secret.
- (48) J. R. W. asks: 1 Is there a self-closing telegraph key in successful operation? If there is, remaining ingredients are inexpensive. canyou give a description of it? A. We are unable to find any self-closing telegraph keys in actual use. 2. Would a key of this kind be of any value if a success? A. It would depend somewhat on the manner in which it operates. We could not tell without seeing a sketch is not exposed so as to be washed off by rain, etc. Soror description of it.
- nickel plating tanks with, so they will not leak—something that will last? A. Coat the inside with good asphaltum, applied in the melted state. See article on make a madder containing 1/2 pound of madder, 2 ounces Electro Metallurgy, Scientific American Supplement logwood chips boiled in a gallon of water; brush this No. 310.
- (50) W. A. R. asks: Why is it that with a steam fire engine you cau create a greater pressure in the air chambers than the pressure of steam which is in the boiler? It is a piston engine, with the steam cylinder on one end of the piston, and a plunger pump on the other. And yet 80 pounds steam pressure will work up 150 pounds water pressure. A. Because the steam piston has a larger diameter than the water piston.
- (51) W. M.—The method of removing superfluous hair by electrolysis is described accurately in Duhring's Diseases of the Skin, 3d edition, page 425. Dr. J. Magee Finny, of Dublin, has been very successful in using this method.
- (52) C. C. B. asks: What causes the report on firing a gun? In a controversy on the point, a man in this shop claimed that it was caused by the air rushing back into the barrel of the gun, and was not made till the air reached the breech on its return. I maintained that the outrush of gas dealt the outside air a blow, projecting the sound waves in advance of it, and that the air did not rush back into the barrel at all, as the barrel is already full of the gas caused by the com bustion of the powder, and a comparatively slow change of place, or endosmose and exosmose, takes place between the gas and the outside air. A. It is the blow of the explosion on the air. Your views are correct.
- (53) J. W. asks: 1. Does it make any difference as to the amount of wire you use for the secondary coil of an induction coil to obtain a spark? A. Up to a certain limit the more fine wire you use the lighter but when the light a close of the light and the light and the light a close of the light and A. Of the accreain limit the most and white secondary coil is too better; but when the wire of the secondary coil is too same dynamo operate a faradic coil with an automatic the diploma face down upon a flat table; brush good, far removed from the influence of the primary and its currentbreaker precisely as a battery does? A. Yes. battery should be sufficient to operate a coil of the size given. 2. Is it necessary to have a commutator for a dynamo machine? A. We know or no practical dynamos that operate without a commutator.
- (54) H. D. writes, asking for a little information in regard to lining up a propeller engine shaft; some of us here differ in regard to the right way of finding this out. A. If you know that the cylinder is in line draw a line through it and down past the shaft; by traveling the crank pin to the upper and lower center, you can see if is true to the line of the cylinder; then to test it at half stroke, draw a line at right angles to the general fore and aft centerline, and travel the pin to it.
- porous paper one-sixteenth inch thick as fireproof as A. The old distinction was that in the low pressure enpossible, and also make it as hard as possible without destroying porosity. What chemicals or ingredients a high pressure engine exhausted into the atmosphere, can be combined, and what proportions, to accomplish my object? A. Paper can be made fireproof by dipping it in a solution of alum and then drying. Newspapers but the distinction of the two is of late years being ing well water, and it is very salty; is there no remedy are rendered fireproof by dipping into a solution of worked out, as we have engines working under 80 to to make the water soft like rain water? A. We know

inches? A. We do not know that this point has been luted hydrochloric acid of 10° B. while hot, and drying determined. 3. Would two carbons and one zinc in a in the atmosphere. Fireproof paper is generally made battery give better results than a pair, and what should by using fireproof materials, such as asbestos. See be the thickness of each? A. Two carbons and one | also Scientific American for November 10, 1883, and

- (56) C. W. asks whether it makes any difference if the layers of wire used in the primary coil of the "Little Giant Battery" are not wound tightly, and the wires of each layer are very close together. He covered wire. Is this is a sufficient amount to use? but it worked for about two hours, then it failed. A. A. iron is any more liable to be struck by lightning than A. We do not recognize the "Little Giant Battery" by Grenet battery is not adapted to continued use. It name. The wires of your coil should be carefully wound. One ounce of No. 38 wire should be sufficient.
- (57) H. B. asks (1) how the porcelain that is put into iron kettles is put on. Is a brush used, and (43) G. J. S. asks if lightning would be then is it put into a kiln and baked? A. Iron ware is enameled with porcelain by first cleaning the surface free from moulding sand, then heating the articles in an oven to a low red in the dark, or what is called a black heat, to slightly oxidize the surface and free it from grease. Then brush the powdered enamel mixed with water, and dry quickly. Then bake with a red heat. 2. How is the porcelain mixed? Is it a powder, phone work better with brass than with copper wire? and mixed with water or some other liquid? Please A. A light twisted wire cable is said to be the best inform me how to make the liquid or composition. Also where I can get the porcelain. A. For the second or finishing coat, brush on the glaze coat and treat as the first. For the first coat make a mixture of 66 parts calcined flint ground to a powder, 34 parts borax. Melt these together and pulverize, then add 12 parts potter's clay. Mix the whole with water to the consistency of paint, and apply as above. For the glaze coat take 15 parts borax, 73 parts powdered glass, 12 parts soda. Mix and melt, then pulverize and apply with water. Bake at a red heat.
  - (58) F. A. L.—The oil of bergamot is obtained from the fruit rind of Citrus bergamia, and is extracted by expression. The oil of Portugal is similarly obtained from the rind of the sweet orange, and the oil of canella is procured from the aqueous distillation of the Canella alba. Opium is the juice obtained by cutting the unripe rind of the white poppy, and hardened by exposure to the air.
  - (59) W. P. W.—The following is the formula for Batchelor's Hair Dye: No. 1. To 1 ounce pyrogallic acid dissolved in 1 ounce alcohol add 1 quart soft water. No. 2. To 1 ounce nitrate of silver, dissolved in 1 ounce of concentrated ammonia, add 4 ounces of soft water. Apply each number alternately with separate broshes. The nitrate of silver is worth \$1.25 per ounce, and the pyrogallic acid 50 cents per ounce. The
- (60) D. G. asks: Can canvas be made fireproof, that is, to a certain extent, so it will not ignite from sparks from a boller used at a portable saw mill? A. A coating of soluble glass will answer, provided it ENTIFIC AMERICAN SUPPLEMENT, No. 245, gives a num-(49) L. C. B. asks what to line silver and ber of recipes for the purpose of rendering fabrics fire proof.
  - (61) J. R. M.—For mahogany staining over the wood while hot; when dry go over this with a solution of pearlash, 2 drachms to 1 quart of water; size, and polish. The wood is then carefully washed, dried, and polished in the usual manner. The above or in fact any desired stain can be placed outside the rug. A figured border can be put on by means of a stencil, that is, staining or the reverse such parts as are not protected by the plate.
  - (62) S. O. asks for a good varnish or polish for pianos or finish on furniture. A. Try the following: Put in a bottle 2 ounces gum sandarac, 1 ounce shellac, 1/2 ounce gum benganium, 1 ounce Venice turpentine, and a pint spirits of wine. Color red with dragon's blood or yellow with saffron. Stand in a warm place till gum dissolves, then strain for use.
  - (63) D. W. De S. asks for a receipt for sheeting and preparing wax for flowers. A. Wax that is used for modeling is generally the white variety, which is melted and mixed with lard to make it malleable. In working it the tools and the board or stone are moistened with water to prevent its adhering; it may be colored to any desired tint with dry color. To make it into sheets it may be run into suitable moulds.
  - (64) D. W. W. asks (1) if a dynamo elecas electric generator for medical and surgical puposes. A. The current from the dynamo electro machine is substantially the same as that produced by a battery. 2. Cannot one man furnish the power with a dynamo constructed for the purpose, to bring the usual cauterizing electrodes to a white heat? A. It would require 4. What percentage of corn is starch? A. The average quantity in flat American maize is 501/2 per cent. In the flat white and yellow varieties 5434 per cent is obtained. Indian corn contains 67.55 per cent of starch. 5. What proportion of the stock does a distiller succeed in converting, or how much starch remains unconverted? A. The amount distilled is limited only by the quality of the apparatus and perfectness of the metbod em ployed. 6. What is the reason for part of the starch remaining unconverted, or what stands in the way of total conversion? A. Theoretically, there is no reason why the entire amount of starch should not be converted, but practically there is always means of loss which cannot be avoided.
- (65) J. E. asks: 1. What is the difference (55) J. R. J. writes: I wish to make a soft between a low pressure and a high pressure boiler?

- 2. Also for a work in that line. A. We would recommend to you Roper's Engineer's Handy Book, Haswell's Engineer's Pocket Book, and Perry's Elementary Treatise on Steam.
- (66) O. Z. writes: 1. I have made an induction coi according to directions given in one of your SUPPLEMENTS, but instead of using the naked copper wire for the secondary coil. What is the cause? A. Possibly your wire is broken or short circuited. 2. says he has wound one, using 1 onnce No. 38 silk. I have constructed a battery on the Grenet principle; runs down in a short time. 3. How much battery power would be required to work a small electric light (arc light carbons a quarter of an inch, and incandescent lamp of small size)? A. 20 to 25 cells of Bunsen battery will operate a small arc light. It requires from 40 to 60 cells to run an incandescent lamp.
  - (67) G. A. W. asks: Which is the strongest (that is, support the greatest weight)—a six inch solid iron column, or a six inch hollow column two inches thick? The length of the columns immaterial. A. The solid cylinder will sustain the greater load.
  - (68) J. D. B. asks: 1. With what velocity does air move to fill the vacuum created by the passage of lightning? And how fast would it move in a tube previously exhausted? A. The theoretical velocity of air flowing into a vacuum is 1347.4 feet per second. Into an exhaust tube it would flow with about 0.7 of the above velocity. 2. What is the best rule to determine the speed of vessels propelled against or from a current? A. For obtaining the actual speed of a boat in a current, add the velocity of the current to the shore rate when running against the current. Subwhen running with the current. 3. What degree of heat would friction of the air cause on a smooth surface moving at the rate of 600 feet per second? A. We have no data as to the amount.
  - (69) W. O. M. asks: 1. Will wood expand by heat? A. We doubt if there is any practical expansion of wood by heat. 2. If water is running over wood, ments. He says it was obviously untrue so far as paint will the wood soak in any of the water? A. Yes.
  - (70) G. L. F.—For copper dipping solutions use 31/2 ounces sulphate of copper, 31/2 ounces sulphuric acid, 2 gallons of water. Dip no longer than to obtain a thin coat of copper. If left too long in the dip, the copper will be spongy and muddy, and will rub off. Another plan is to tumble the small work in saw dust wet with the above solution.
  - (71) E. L. D. asks: What metal will stand the most degrees of heat, and how many degrees it is?

    A. Platinum has a melting point of 2,600° Centigrade, or 3,080° Fahrenheit. The melting point of iridium may be slightly higher, but practically platinum is the highest-melting element.
  - (72) J. M.—The great trouble in hardening mill picks, especially the solid picks, arises from unequal heating. More picks are destroyed by overheating the corners than by anything in the nature of the hardening or the bath that they are hardened in. The lowest heat that will harden, in clear water with a little salt in it, is all that is needed. Never plunge the point into the fire, but heat from the eye. Leave the point in the cool part of the fire until the body is hot. If the hardening is well done, the pick should stand well with very little drawing of temper—only to a straw color.
  - (73) E. F. B. writes: In your Supplement No. 425, page 6783, Feb. 23, 1884, is a cut of an incubator heated by electricity. Please tell me if the application is patented; if not, where can a thermometer be obtained with a cut-off attachment? A. The electrical incubator illustrated in the SUPPLEMENT is a German patent. We could not inform you whether it was pa teuted in this country or not without making a search. For further information on incubators, etc., address Perfect Hatching Co., Elmira, N. Y.; A. M. Halstead
  - (74) G. V. A.—For gilt lettering upon wood print the letters upon the wood with yellow ink. Then brush gold bronze powder upon the printed work with wood is more difficult to urint upon than soft, and may require type of harder metal than ordinary. You may try it with printing type. You can get the yellow ink from a printer, and the gold bronze from a painter.
- (75) S. G.—We fear that your photographic tric machine is not an equivalent of a galvanic battery lens is of too short focus for a telescope. An object glass of the diameter that you name should be about 3 feet focus. If the lens is achromatic, it will make a very fair telescope if only 2 feet focus. For eye pieces, you will see a full description in SCIENTIFIC AMERICAN SUPPLEMENT No. 399.
  - (76) E. L. K.—The mounting of a parchment diploma may be done in the same manner as picof thin white muslin a little larger than the parchment. Smooth the mustin down with the hand, and cover with one or two thicknesses of thick wool cloth or a blanket, and press with a flat board and a weight; let it dry over night, then trim the edge for framing.
  - (77) J. C. H. asks: 1. The number of cubic feet a ton of anthracite coal, chestnut size, should measure? A. For Lehigh coal, 40 cubic feet to a gross ton. For Lackawanna coals 42 to 45 cubic feet per ton. This is for egg size. Add 5 per cent for chestnut. 2. Is there any cheaper material with which ground or flocculent asbestos can be mixed and fashioned into sheets of a firm and stiff consistency, which will form a waterproof composition? And if so, and tanks of the same be made, what substance should be used to cement the laps at the corners? A. Asphalt melted with the asbestos, or shellac varnish makes good waterproof material, as is also paraffine. The first is the cheanest. and will probably give satisfaction.

to operate above coil, the size of plates being 5x7 soluble glass of 25° Baume, then neutralizing by di- 100 pounds pressure which exhaust into a condenser, of no remedy for well water that has salt in it. Water that is hard from lime may be made soft for washing purposes by soda, borax, or ammonia. Such water is not suitable for drinking. If you wish to obtain pure water for drinking, you can make a simple still and condenser. Blow air through the condensed water to make it palatahle.

- (79) M. L. W.—The stenograph or short and reporting machine is a French invention, and may have been made in the United States. It has a telegraphic alphabet. Is described in Knight's "Mecbanical Dictionary," article "Stenographic Machine." Also back numbers of Scientific American Supple-MENT.
- (80) R. H. L. asks where the most strain would come on the steel spokes of an expert Columbia bicycle, above or below the heel?—supposing the rider weighed about 150 pounds, and it being a 54 inch machine-and where when it was without rider? A. The greatest strain or tension upon the wire spokes will be in the same position whether the machine loaded or not, and is supposed to be at an angle of about 25° from the point of contact with the ground.
- (81) R. H. K. asks: 1. How he can loosen the shutters on outside blinds without taking the whole thing to pieces? They have been stuck by paint, I suppose. A. If the paint cannot be cut out with a knife, you can take off the whole of the paint with strong potash. We think the only proper way is to take the shutters apart and ream out the holes, and scrape off the excess of paint from the leaves. 2. Also how to prevent a botany box from rusting? A. Clean your botany box thoroughly and paint with Prince's metallic paint and boiled linseed oil, and dry in the sun,
- (82) W. J. A. writes: I have heard of a tract the velocity of the current from the shore rate chemical or paint works in New York, in which not oue of the employes (it is said) has died of consumption during a space of 25 years; it is also stated that persons going there to work afflicted with lung diseases have been completely cured. A. One of the oldest and largest paint manufacturers in New York thinks he heard some such report as you mention, years ago, about curative effect of work in paint and chemical establishbusiness was concerned, and it seemed to him, as it does to us, ridiculous as to chemical works, as it certainly would be if said in regard to white lead, zinc white, sulphuric acid, etc.

MINERALS, ETC. - Specimens have been received from the following correspondents, and examined, with the results stated:

T. C.—It is impossible for us to give information relative to ingredients of an iron ore, unless it be submitted to chemical analysis. The expense of such an examination would be about \$15.00. From the appearance of the specimen received, we would hardly recommend you to have it analyzed .- A. M. F .- The sample is pyrite (iron sulphide) of no apparent value. -R. T. B.-No. 1 is a close grained silicious rock. No. 2 consists essentially of hornblende and mica. The specimens have no value for economic purposes as far as their metallic ingredients are concerned.-J. T. C.-The specimenis pyrite (iron sulphide) of no economic value except in the manufacture of sulphuric acid.-V. W. P.—The specimen is pyrite (iron sulphide). It may carry gold, and an assay costing \$5.00 will be necessary to determine the value, if any.-B. A. B.-The specimen is known mineralogically as chalcopyrite. It is a mixture of copper and iron sulphides, and sometimes carries gold.

# INDEX OF INVENTIONS

For which Letters Patent of the United States were Granted

May 13, 1884,

# AND EACH BEARING THAT DATE.

[See note at end of list about copies of these patents.]

Animal trap, P. R. Erling	
Anvil, C. Fisher	
Axle box, car. M. R. Carey	298,552
Baje tie, A. E. Russell	298,410
Bale tie, J. White	298,645
Band tucker, W. M. Kealen	298,389
Barrel trussing machine, J. Reid (r)	10,479
Bathing cabinet, folding. R. A. Horning	298,585
Beer and other alcoholic liquors, apparatus	for
preserving, C. E. Haynes	
Bench dog, R. Doty	
Billiard and pool bridge, G. Borst	
Billiard table time register, E. B. Pope	298,402
Bit brace, C. H. Amidon	
Black leading machine, G. E. Lloyd	298,595
Blast furnace bell and hopper mechanism, F.	
Gordon	298,870
Block. See Toy building block.	
Blocks, stones, etc., making artificial, L. Ros	en-
thal	
Blower, rotary, J. L. Newman	
Board. See Ironing board.	,
Boat. See Dumping boat.	
Bobbin winder, G. W. Clapp.	298,554
Boiler. See Steam boiler.	
Boiler or vessel employed in the treatment	of
fibrous materials for the manufacture of par	
pulp and for other purposes, I. S. McDouga	11 298.602
Boiler setting, W. T. Hildrup, Jr	298,380
Bolster plates, die for making, H. James	
Room and gaff for vessels, E. Bangs	298.545
Boot, G. Valiant	298,638
Boot and shoe seam, G. Valiant	298,637
Boot or shoe, G. C. Buch	
Boot or shoe, H. T. Marshall	298,599
Boot or shoe sole, A. J. Mott	
Boot, rubber, J. Banigan	298,546
Box. See Axle box. Cash box. Paper box.	
Box fastener, J. W. Harlow	298,689
Brace. See Bit brace.	
Bracket. See Roofing bracket.	
Bricks, tiles, etc., press for making, T. Whittak	er 298,646
Bridge signal, draw. J. N. Williams	298,647
Brush, paint, J. Elliott	298,359
Buckle, J. W. Smith	298,511

340	-	<i></i>	A.100
Buckle, harness, H. C. Colton		Gauge. See Weatherboard gauge. Gas, apparatus for generating and carbureting hydrogen L. S. Groves	
Button, G. W. Prentice.  Button fastener, W. Halkyard.  Button fastener, R. Sanford	298,403 298,464	Gas by electricity, apparatus for lighting, L. S. White	298,531
Button fastener, F. A. Smith, Jr  Button setting instrument, J. F. Atwood Can and case, J. M. Bean	298,423 298,333	Gearing, differential, R. Lavery	298,418
Car braces, gauge for cutting, C. Mattice	298,467	apparatus for extracting, C. P. Bonnett Grain binders, bundle carrier for, W. Collins Grain drill force feed, J. H. Keedy	298,449 298,390
Car coupling, E. H. A. Haupt	298,406	Grate bar. S. Smith	298,493
Car coupling, J. D. Smoot Car coupling, J. A. Vogler Car coupling, Washburn & Journeay	298,523	Gun, maguzine, L. L. Hepburn	298,650 298,515
Car coupling link, D. Hayes	298,666	Hand drill, I. M. Furbish	
railed, M. C. Woods Cars with cables. device for coupling, J. C. Dolan. Card holder and exhibitor, S. L. Davis Carpet stretcher, J. W. Thompson	295,673 298,354	Harness, C. Kifer	298,589
Carpet stretcher, R. F. Truslow	298,521 298.349	Hat rounding machine, J. Wenstrom  Hatching eggs by artificial heat, apparatus for, C.  E. Hearson	298,643
Carrier. See Cash carrier. Cart, cotton and corn planter, and manure distributer, combined riding, A. J. Arrington		Hayfork, horse, J. S. Gochnauer	298,484 298,378
Cart, road, D. Argerbright	298,415	Hinge for mirrors, A. Jelinek	298,480
Cartridge shell G. Kynoch	298,696	Holder. See Card holder. Coin holder. Match box holder. Pen holder. Pneumatic holder. Tally card holder. Whip holder.	
Cash and parcel carriers, elevator for, A. T. Atherton	298,569	Hook. See Check hook. Ladder hook.  Hook, F. A. Smith, Jr	298,352
Cash carrier, R. Gornall. Cash carrier, O. B. Hall. Casting plumbers' traps, machine for, C. E. Heiss	298,373	Horse tooth cutter, J. 11. Dancer  Hose, adjustable shelffor holding fire, Guibert & Andrus	298,373
Casting steel ingots, compression apparatus for, G. W. Billings	298,395	Hub attaching device. G. H. Hombach Hub, wheel, J. P. Warner Hydrant and street washer, A. G. Daykin	298.525 298.355
Chain, flat, A. Vester Chain wrench, W. H. Brock Charm, watch, R. L. Allen Charm, watch chain, F. T. Pearce	298,442 298,540	Hydraulic elevator, E. B. Ellington	<b>298,5</b> 18
Check book for harness, back strap, W. N. Wilson Chuck, lathe, E. L. Mansfield	298.535	Inductorium, C. J. Van Depoele	298,431 298,469
Clasp. See Traveling bag clasp. Clasp, C. C. Shelby	298,508	Insulator pins, machine for turning. J. J. Baldwin	298,543
Clock for machinery, speed, W. H. Lord	298,708 298,608	Ironing board, J. W. Smalley Jack. See Lifting jack. Screw jack. Wagon jack.	
Cock and faucet, G. B. McCracken Cock and sewer gas cut-off, compound water, W.		Jar. See Hermetic jar. Joint. See Steam pipe joint. Jug. J. R. Graver	
Coffee, preserving the aroma of, M. F. Fowler Coffin, J. V. Rowlett Coin holder and deliverer, J. L. Donnelly	298,684 298.409	Ladder hook, J. F. Manahan Ladder, portable, V. Béssier Lamp socket, incandescent electric, S. Bergmann Land roller, K. W. Jones	298,660 298,658
Collar, A. J. & N. L. McAdam Collar coupling, horse, S. J. Bowers Collar pad fastening, horse, J. Scherling	298,489 298,343	Lantern and wonder camera combined, magic, J. B. Upham  Lathe for turning polygonal forms, L. Weisse	298,636
Condenser head for exhaust pipes of steam engines, W. C. Lyman	<b>29</b> 8.698	Lathe, wood turning, L. Weisse Lifting fack, M. R. Baldwin, Lifting jack, C. Fisher.	298,529 298,385
Cooler. See Water cooler. Cornstalk cutter, Atkinson & Phelps Corsets, clasp fastening for elastic stays in, T. H.	298,655	Lifting jack, W. L. Hall	298,700 268,357
Ball Cotton scraper and chopper, combined, C. J.	298,491	Line stopper, J. FurgusonLiniment, S. Potter	298,706
Counter stiffeners, machine for forming, G. T. Shepley	298,420	lock. Permutation lock.  Lubricator, Hope & Homan  Lubricator and measure, J. S. Peter	298,497
Cultivator, cotton and corn. T. H. Baird.  Curtain fixture. F. G. Robbins.	298,609 298,334	Lunch box, W. F. Berghofer.  Mail pouch lock, G. Deimel.  Mail sack tag. S. W. Brackett.  Mat. See Floor mat.	298,451
Curtain pole tip, J. Kroder	298,592	Match box holder, W. N. Weeden	298,502
Dental foil condenser. R. S. Williams	298,717 298,716	Crosby  Measuring machine, grain, J. & A. Nafziger  Measuring vessel, liquid, M. F. Robinson	298,670 298,612
Derrick, A. Reitz Draught equalizer, S. Ray Drawer lock, E. G. Gory	298.405 298,622	Mechanical movement, J. W. Dodge	298,671 298,376

A printed copy of the specification and drawing of my patent in the foregoing list, also or any patent sued since 1866, will be furnished from this office for 25 ents. In ordering please state the number and date f the patent desired, and remit to Munn & Co., 351 Broadway, New York. We also furnish copies of patents ranted prior to 1866; but at increased cost, as the pecifications, not being printed, must be copied by

anadian Patents may now be obtained by these uventors for any of the inventions named in the fore-toing list, at a cost of \$40 each. For full instructions address Munn & Co., 361 Broadway, New York. Other oreign patents may also be obtained.

## Advertisements.

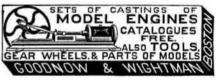

nside Page, each insertion - - - 75 cents a line. Back Page, each insertion - - - \$1.00 a line.

Ack Piece, ench insertion - - - 31.00 a line.
(About eight words to a line.)
Engravings may head advertisements at the same rate
per time, by measurement. as the letter press. Advertisements must be received at publication office as early
as Thursday morning to appear in next issue.

LABORATORY FILTER PRESS .-- A aper by Jervis E. Foakes, describing a filter press, contructed on a new principle, for filtering substances rhose nature has hitherto rendered them scarcely possible of filtration by the ordinary process. Illustrated rith three figures. Contained in SCIENTIFIC AMERICAN UPPLEMENT, NO. 391. Pricell cents. To be had at his office and from all newsdealers.

For Cider, Lard, Tallow, Cotton Seed and Parafine Oils, Cloth and Paper Baling, Leath-er Belting, and Book Binding. Boomer & Boschert Press Co., Syracuse, N. Y.

BUGGIES for the TRADE. Territory given.
