202

ENGINEERING INVENTIONS

A steam actuated valve has been patented by Mr. John S. Bartlett, of Akron, O. This invention covers a novel construction and combination of parts for a steam actuated slide valve for steam engines. in which there is a long hollow piston, working in a cy linderimmediately over the top of the slide valve.

A car coupling has been patented by Mr. George J. Ferguson, of Greenville, Texas. The invention consists mainly in a special construction of coupling device in combination with a spring for helding it to the opened or closed position, and co-operating with the same for automatic action, the ordinary link being used, and the draught being taken in the same way as by the common pin.

A car coupling has been patented by Mr. Otto C. Meusebach, of Marion, Tex. The drawhead has a raised portion in the bottom of its cavity, a shaft journaled in the drawhead extending to the sides of the car, and having a tongue with its ends bent and provid-ed with weights, a lever being pivoted on the top of the car, with a rod connected therewith and with one bent end of the shaft.

A car coupling has been patented by Mr. Winslow Forbes, of Riverhead, N. Y. This invention covers a novel construction by which cars may be coupled or uncoupled without requiring the trainmen to go between them, and the device is of such a nature that, by providing a special link socket and pin hole, cars may be coupled to other cars having the ordinary link and pin drawhead.

A grate bar has been patented by Mr. Joseph B. Miller, of Wilkesbarre, Pa. It is made with perforated and grooved top plates having narrow spaces between their adjacent ends and cast upon lugs cast upon the supporting ribs, whereby air can circulate freely through and around the top plates, and the whole so made that the grate bars will not be injured by expanding and contracting when heated and cooled.

A car coupling has been patented by Mr. Thomas L. McKeen, of Easton, Pa. The draw- | dow sash can be made to spring the alarm. head has longitudinal guides, and a grooved, spring pressed follower, there being also other novel features, the invention being intended mainly to improve car couplers formerly patented by the same inventor. Another coupler also patented by the same inventor provides mainly an attachment for a sliding block which relieves the coupling pin of friction when being lifted, and supports it when raised, with a stop to prevent it from being wholly withdrawn from the drawhead.

MECHANICAL INVENTIONS.

A lathe has been patented by Mr. Jackson O. Haas, of Hepler, Pa. The principal feature of this invention consists in providing a lathe with two stationary center plugs, so that the face plate or spindle of the lathe is not affected by the weight of the work placed between the two stationary pointed center plugs

Mr. Calvin Wilson, of Caro, Mich. Combined with a centrally bored body having a slanting hole in its side, is a centering rod, spring, and pin, fitted to the slanting Silas M. Hess, of Bloomsburg, Pa. It consists of paralhole, with other novel features, the invention being more especially designed to facilitate the holding of work in a watchmaker's lathe.

AGRICULTURAL INVENTIONS.

A rotary harrow has been patented by Mr. James R. Hicks, of Kansas City, Mo. This inver- Hot Springs, Ark. The front and a partien of the bottion covers a novel construction, intended to keep corn tom are hinged to swing out of the way, and the bottom ar cotton stalks down among the harrow teeth, to break them and prevent their running up through the harrow, and also so to hang a pair of harrows that either may remain fixed on the ground while the other revolves around it in turning corners.

..... MISCELLANEOUS INVENTIONS.

A wheel guard has been patented by Mr. Alma B. Cole, of Kingston, Ill. It consists of a metal frame with its top curved down toward the rear, upwardly projecting bars and a sheet metal covering, to prevent persons being killed or mutilated by the wheels of street or railway cars,

An automatic fan has been patented by Mr. Alister M. Richardson, of Charleston, S. C. This invention consists mainly in pivoting the standard in which the frame is pivoted so as to permit of adjusting the standard at different inclinations, being an improvement of a former patented fan of the same inventor.

A gas check for fire arms has been pat- forming a yielding receptacle for glass or mica, more ented by Mr. John E. Tyler, of Roxobel, N. C. This especially intended for securing mica in the chimneys invention covers a special construction and arrangement of parts to provide a means for preventing gas generated by the discharge of a cartridge from escaping through the space between the adjacent ends of the cylinder and barrel.

A thill coupling has been patented by Mr. Abijah L. Romans, of Sinclairville, N.Y. Combined with an axle clip is a spring held thereon, and a latch pivoted to the clip and acted upon by the spring, the latch preventing the withdrawing of the bolt, the object being to securely couple the thills and prevent rattling.

A burial vault has been patented by Mr. Leonard Dydynski, of Buena Vista, Ohio. This invention provides a special construction for a vault of stone or other indestructible material to be air and water tight, and with such locking that the lid cannot be taken off without breaking the slabs composing the vault.

A machine for making fellies has been patented by Mr. Henry D. Jeffrey, of Winona, Minn. Combined with a cutter head is a standard and gauge rod held parallel with the plane in which the cutter head revolves, with other novel features, to form seats on the inner edges of fellies, or on any stick around the mortises in the fellies.

A cork cutting machine has been patented by Mr. James L. Murphey, of Pittsburg, Pa. It has a sliding and revolvingtubular shaft through which feeding itself and ejecting the corks.

A burglar alarm has been patented by Mr. Frederick D. Hill, of New York city. It has an ed to a pivoted lever connected by a rod and band and pulleys with a roller, whereby a movement of the win-

outer edges of the guides by clips, and curved braces or bars uniting the axles, so no king bolts are required, and the wagon can be turned very short.

A bark mill has been patented by Mr. John McKendrick, of New York city. It is for grinding and reducing bark for tanners' use, and besides a rotary cutting cylinder with removable teeth, has a feed cylinder and pressure roller. both held to their work by springs, and the latter holding the bark in position upon the cutting or face plate.

A sign board has been patented by Messrs, William H. Bushnell and William H. Van Gilder, of Perrysville, O. It is of sheet metal or covered therewith, on which metal or other raised letters are to be used, and so made that the letters are protected to a A lathe chuck has been patented by great extent from snow, rain, etc., and so water cannot leak between the board and its metal covering.

> A culm bar has been patented by Mr. lel bars united by cross pieces and perforated sections having on their under sides transverse lugs, so that the cooling bars are not liable to get hot enough to burn out. and in case one burns out it can be replaced very easily and an entire new bar is not required.

> A drawer for drawing paper and documents has been patented by Mr. Alexander Russell, of portion has a shoulder joint to rest on a portion of the drawer bottom to hold the door in position to serve as a paper rest.

> A nut lock has been patented by Mr. Alfred Fisher, of Edwards, Miss. The nut has a planelarged slot at one end to permit the turning of the nutthe slot of the plate,

A boop for barrels, tubs, etc., has been is made of wire, the extremities of which have a lock consisting of a head of each wire and a coil of the ex- ligations to its editor. tremities of the wire loosely fitting upon each side of the head, together with a spacing skeeve, to adapt the same wire hoop for different sizes of harrel or different sections.

A churn has been patented by Mr. Eli H. Wood, of Cherry Valley, Mo. Combined with a A school desk has been patented by Mr. i the most up and frame is a rocking shaft having a rack on Elgin R. Shepard, of Northfield, Minn. By this inven- one end and cross piece on the other, the ends of the tion the seat may be tipped to a vertical position, the cross piece being connected with foot levers pivoted on back of each seat used as a receptacle for books and as the frame, and the rack engaging with a bevaled pinion a desk for the next seat behind, an arm rest is provided on the upper end of a shaft journaled in the top plate at may be folded out of the way, and the seats may be of the frame, its lower end receiving the dasher shaft. A still has been patented by Mr. Martin has been patented by Messrs. Howard C. and James A. ing, and demolishing, which have been solved in different tank, an inner filtering tank with fabric ends, with pertract the volatile oils, especially fusel oil, before such forsted feed box and other novel features, to save and vapor reaches the flake stand or condenser, together concentrate the light and fine particles of ore, such as sulphirets and chlorides of silver and gold, now frequently carried away with the waste water. A cotton harvester has been patented Messrs. Leander C. Benson and Eugene F. Perry, of by Mr. Charles L. Walter, of Boston, Mass. This isvention covers a novel construction and combination of parts of a machine to enable the cutton to be picked from the plants and delivered to bags without damage to the picked staple or to the cotton bolls remaining onhe plants, the machine to be drawn by one or two animals walking between the rows of plants.

of oil stoves.

A faucet has been patented by Mr. Henry P. Drew, of New York city. Combined with the stock, plug, spring, and screw plug, are a washer and screw, and the faucet is so made that the plug springs can be readily adjusted as the pressure to which the faucets may be exposed may require. The same inventor has likewise patented a cock for gas, steam, and water fittings, as an improvement of one of his former patented inventions, so that such cocks will be more convenient to use and less liable to break or get out of Conn. or**de**r.

NEW BOOKS AND PUBLICATIONS

PRACTICAL AND ANALYTICAL CHEMIS-TRY, BEING A COMPLETE COURSE IN CHEMICAL ANALYSIS. By Henry Trimble, Ph.G. Philadelphia: Blakiston, Son & Co., 1885.

The field of elementary chemical analysis is already very well occupied. What the analyst really needs most is a more advanced and complete work. such as a younger Fresenius would write: but still, there is always room for any book which presents even the elements in a simpler and more compact form, and such has been the purpose of the author of the present volume. The great secret of successful analytical work is the cultivation of accuracy in the various chemical manipulations, for it is this faculty a rod passes loosely, a pivoted lever on which a cam alone which will yield trustworthy results. Many a acts being connected with the rod, the machine being student whose theoretical knowledge is unimpeachable adapted for cutting cylindrical and tapering corks, fails utterly in practical work, because he lacks this requisite delicacy of touch, which seems almost to be intuitive in the born chemist. Professor Trimble has therefore done wisely in introducing his subject by a angular plate carrying a clockwork with a bell, with an short preliminary course on the different operations of arm on its escapement post to engage with a pin attach- filtration, evaporation, ignition, etc., which are to form so important a part of the student's afterwork. The main body of the book is devoted to qualitative determinations. A few new features have been intro-A wagon gearing has been patented by duced in the grouping of the elements, but for the Mr. Henry Seeman, of Durham, N. C. Combined with most part it follows Galloway and the older chemists. a wagon box or frame is a segmental guide held on its In this respect, indeed, any radical change is hardly under side at each end, axies being held against the possible. The merit of such a work must depend almost entirely upon its arrangement and material excellence. The third division, on quantitative analysis, is too fragmentary to be of much value. It is a book which will be found very useful where but little time can be devoted to the study of analytical chemistry, for it has been made admirably clear and compact,

THE AMERICAN ENGINEERING REGIS-TER. Lewis M. Haupt, A.M., C.E., editor. New York: Engineering News Publishing Company, 1885.

Some years ago, Professor Haupt began the practice of publishing a register which gave the names, occu-pation, and address of his own students in engineering who had graduated at the University of Pennsylvania; and though intended only for private circulation, it proved so very useful as a means of communication between the members of a profession necessarily widely separated that this larger work, including the whole brotherhood of American engineers, cannot fail to be greatly appreciated. It purpose is the same. It is intended to farnish a ready means of communication be-tween our large and increasing class of constructive engineers. The general alphabetical list contains the names of all who could be reached, and though in this first issue there are doubtless many omissions, the systhem followed by the editor promises in time of station of any special engineering, mechanical, or solve mation of any special engineering mechanical engine The value of the work is licereased by the insertion of some of the fundamental formularly use by the several groups of engineers. An alphabetical list of American sided stud on its back, the lock plate having an en- railways and the names of their chief officers is also added, and will be useful to engineers interested chiefly stud when screwing home the net, and there is a dog in locomotion. Professor Haupt's position in the adapted to act against the nut to prevent backward engineering world, and his large acquaintance among movement of the lock plate, with a shoulder to enter members of the profession, eminently qualify him for the work which he has andertaken. With the co-operation of his fellow engineers, the register will become unpatented by Mr. James H. Bard, of Jackson, Tenn. It doubtedly an authoritative reference, and the careful work already done has placed the profession under ob

A PRACTICAL TREATISE ON THE CON-STRUCTION OF TALL CHIMNEY SHAFTS IN BRICK, STONE, IBON, AND CONCRETE, By Robert M, and Francis J. Bancroft, Manchester: John Calvert. 1885.

The authors of this near little treatise have acted on the principle that experience is the best teacher; and aside from a brief introduction on general questions of foundation, strength of materials, and requisites of good Ohio. construction. they have dere d their one. to the description of shafts already constructed, and An apparatus for concentrating ores of various problems connected with straightening, mov-V. Monarch, of Owensborough, Ky. The object of the Henderson, of Cherokee, lowa. It consists of an outer localities. The examples selected are naturally for the drum. Always in position, but invisible to others, and most part English, but a number of American struc tures and a few on the Continent have also been described. American engineers will occasionally be annised at the indefiniteness of the information about localities on this side of the water, such as the state- $\left| \begin{array}{c} \mathrm{paper}, \end{array} \right|$ ment that a foundation of piles was used for an iron chimney constructed at Ohio, U. S. A., but on the any quantity. Jesse B. Kimes, Philadelphia, Pa. whole they will find much to interest them. The American shafts selected by way of example) include the principal ones of any great height, such as that of Merrimae Manafacturing Company, at Lowell, the. York. Mass., which is 282 feet, and of the Amoskeag Mannfacturing Company, at Manchester, N. H., 255 feet. The descriptions are all brief and clear, and give usually mumber of cases the cost of construction has also been given, which, in spite of the wide variations in the price of material and labor, will be of value as offering a basis of comparison and estimation. The book is illus-

Business and Personal.

The charge for Insertion under this head is One Dollar a line for each insertion; about eight words to a line. Advertisements must be received at publication office as early as Thursday morning to appear in next issue.

Seam and Looping Machines, patent Burr Wheels, Brushing Machines. Tubbs & Humphreys, Cohees, N.Y. Gunand Machine Makers' Screwdrivers, drop forged from best Teel Steel. Billings & Spencer Ce., Hartford,

A gentleman with first class references and connections solicits correspondence with manufacturers to act as their agent in Germany. Address A. X., box 773, N.Y. Clock Factoryin complete order for sale. Address . E. Osbern, New Haven, Conn.
