tion of drawheads and deadwoods."

debate, from which it was plain that the question of uniformly successful so far as our inquiries have extend-, lamp having a single small Argand burner and nickel obtaining a satisfactory safety car coupler is still one ed. There is room for great extensions of these local reflector. No color screen was used, but, owing to the of the most important that railroad men have to deal lighting companies in all parts of this and foreign with. There is not any particular style of coupling that has yet received more than a sort of negative recommendation, but the lines are pretty clearly laid down that new couplers shall be calculated to couple readily with such other styles as are at present in most In a communication to the Franklin Institute, which general use. The field for further competition is therefore still wide open, and inventors are urgently invited to occupy it until they succeed in working out the difficult problem, and constructing a device which will of chlorophyl and eosin, as follows: command approval. The demand for such improvement is now felt to be the more urgent, inasmuch as has received a great deal of attention during the past New York State requires an approved safety coupler year or two, but there has been, and is still, a great on all cars built after July 1, while in Massachusetts diversity of opinion in regard to the capabilities of the and Michigan similar laws are already in operation, and public opinion seems to insist upon such legislation in most of the other States. The master car builders and the railroads would be only too happy to comply with such laws, if they could find a coupler which would adequately answer the practical requirements of the rail way business of the country; but until they are satisfied that such a style of coupler has been found, the Association think a waiting policy is the best one for the companies, in the hope that American inventive through a yellow glass than eosin plates. Captain genius will yet furnish a satisfactory way out of their difficulties.

A TRANSCONTINENTAL BALLOON VOYAGE.

San Francisco Chronicle, has recently been built in actually increasing the sensitiveness to other colors. that city by Mr. A. P. Van Tassel. It has a capacity of 150,000 cubic feet of gas, and has been constructed for the special purpose of enabling the well known of the lime light spectrum, one on a plain emulsion aeronaut to undertake a journey across the continent, plate, one on a chlorophyl stained plate, one on an from ocean to ocean. The height from the floor of the eosin-stained plate, and one on a plate stained with wicker car to the top of the gas reservoir is 119 feet, and of the dilated reservoir alone 68 feet. The enve- jected by means of an optical lantern and a flint glass lope is made of finely woven cloth, manufactured ex- prism, with a slit measuring one-fiftieth of an inch. It pressly for the purpose, and is varnished, as usual, in will be understood that the different colors have not order to make it gas tight. The car has accommoda- exactly the same relative intensity in this spectrum tion for fifteen persons. It is about twenty-one feet that they have in the solar spectrum, but the differin circumference, and the sides are thirty-four inches ence is insignificant. Short wires were placed so high. The supporting ropes are kept in place by the as to cast shadows on the sensitive plate, to aid in the usual "concentrics." Hydrogen gas will be used for comparison of results. Some of these wires, which I inflating the balloon. The cost of the structure is have marked, occupy the position of Fraunhofer lines stated to be \$6,000. Mr. Van Tassel has had consider; in the solar spectrum. All plates were prepared with able experience in aerial traveling, having crossed the the same collodio-bromide emulsion, and received the Wichita Mountains, 15,000 feet above sea level. His same exposure and development. present attempt is more ambitious than any he has yet made. A careful study of the aerial currents leads him to believe that by seeking the proper stratum of air he can be carried eastward at high speed, possibly 100 miles an hour. The greatest difficulty will probably be due to the Rocky Mountains, which modify the movements of the air currents over a large area of the continent. It is expected that the voyage will be begun some time about the 1st of July. Should it survive the trip, the giant balloon will be taken back to San Francisco, where it will be placed on exhibition.

ELECTRIC LIGHTING AS AN INVESTMENT.

With a view to put at rest the question whether local electric lighting companies are profitable investments, we have recently addressed a circularletter to the general managers of a number of such companies, both East and West, asking for their experience in the matter. We have directed our inquiry in this instance particularly to those operating the Thomson-Houston system.

We have received answers from all parts of the country, and the general tenor of the replies is that many of their local companies are earning better dividends than are yielded by the majority of other new enterprises. The question of profit rests first with the locality, and then, if this be judiciously chosen, with the system employed and the ability displayed in the man agement.

Of those who have stated the exact profits of their

countries.

.... PHOTOGRAPHIC NOTES.

Chlorophyl and Eosin Orthochromatic Plates. we take from the Brit. Jour. of Photography, Mr. Fred. E. Ives, of Philadelphia, Pa., relates some interesting experiments recently made on the combination

The subject of color sensitive photographic processes various color sensitizers. In illustration of this fact I will mention that Becquerel; who first tried chlorophyl, stated that with it he made plates from one-fifth to onetenth as sensitive to the red of the spectrum as to the blue or violet. Dr. Vogel estimated that eosin-stained plates were eight times more sensitive to the yellowgreen of the spectrum than to the blue. I myself stated that plates stained with myrtle-chlorophyl, according to my published method, required even less exposure Abney stated that, according to his experience, stained plates were always many times more sensitive to blue and violet than to any other color; and many persons have believed that the color sensitizers acted more by The largest balloon in the world, according to the reducing the blue and violet sensitiveness than by

> For the purpose of proving the capabilities of chlorophyl and eosin, I have made four photographs both chlorophyl and eosin. The spectrum was pro-

> The plain emulsion plate shows very little action, except in the blue, violet, and ultra-violet; the maxishould be noted here that with gelatino-bromide dry plates the maximum of sensitiveness is in the indigo blue, about G, and they are also relatively more sensitive to green and yellow.)

The chlorophyl plate shows a very strong action all through the visible spectrum-strongest in the red, orange, and dark green; weaker in the blue and violet; and weakest in the yellow-green. In the red, below C, the plate shows about five times as much sensitiveness as in any part of the violet; in the orange red, twice as much; in the yellow-green, one-half as much; and in the dark green, one and a half times as much. The violet sensitiveness appears to be slightly reduced near H. This experiment proves that my chlorophyl plates are remarkably sensitive to \overline{all} and frescoes. colors, as I have many times asserted that they were, and that they are twenty-five to fifty times more color sensitive than those which Becquerel employed in his sensitive to red than unstained plates.

orange, very little in the yellow, a great deal in the

greater number of local companies are operating their I made on one of these chlorophyl-eosin plates, with The report of the committee caused a most animated system than any other, and we find these companies an exposure of one minute in the light of a coal oil yellowness of the coal oil flame, all the colors have photographed correctly. An unstained plate, with same exposure and development, showed only the high lights of the picture very faintly.

-----The Law as to Party Walls.

A party wall in law is the wall dividing lands of different proprietors, used in common for the support of structures on both sides. At common law an owner who erects a wall for his own buildings which is capable of being used by an adjoining proprietor, cannot compel such proprietor, when he shall build next to it, to pay for any portion of the cost of such wall. On the other hand, the adjoining proprietor has no right to make any use of such wall without consent of the owner, and the consequence may be the erection of two walls side by side, when one would answer all purposes. This convenience is often secured by an agreement to erect a wall for common use, one-half on each other's land, the parties to divide the expense; if only one is to build at the time, he gets a return from the other party of half what it costs him. Under such an agreement, each has an easement in the land of the other while the wall stands, and this accompanies the title in sales and descent. But if the wall is destroyed by decay or accident, the easement is gone, unless by a deed such contingency is provided for. Repairs to party walls are to be borne equally ; but if one has occasion to strengthen or improve them for a more extensive building than was at first contemplated, he cannot compel the other to divide the expense with him. In some States there are statutes regulating the rights in party walls, and one may undoubtedly acquire rights by prescription on a wall built by another, which he has long been allowed to use for the support of his own structure.-Building.

Mineral Ultramarine.

J. R. Jackson, F.R.S.-The preparation of ultramarine is as follows : The pieces of lazulite the most rich in color are picked out, they are washed, and then plunged into vinegar, and if the color does not change, the quality is esteemed good. The stones are then again repeatedly heated, and plunged each time into vinegar. By this means they are easily reduced to an impalpable powder. This is then well worked up into a paste with resin, white wax, and linseed oil, to which some add Burgundy pitch. The paste is then put into a linen bag and kneaded under water, which at first mum of sensitiveness is in the middle of the violet. (It assumes a grayish color, resulting from the impurities that are first separated from the mass. This water is thrown away and replaced by fresh, and the kneading recommenced, when the water becomes of a fine blue. This is poured off and allowed to settle, the precipitate being ultramarine of the finest quality. The repetition of the process furnishes color of inferior quality in succession, and finally the residuum, being melted with oil and kneaded in water containing a little soda or potash, yields what is termed ultramarine ashes. The inalterability of ultramarine is a most valuable quality; but this very property is injurious to the effect of old paintings, for while the other colors have changed, this, preserving its original brilliancy, all harmony is destroyed, as may be observed in many old paintings

Convention of Civil Engineers.

The Annual Convention of the American Society of experiments. They are probably 400 or 500 times more Civil Engineers will be held at Denver, Colorado, on July 2, 3, and 5. Sessions for professional discussion, The eosin plate shows no action in the red and and one for the transaction of business, will occupy the three days. At the close of the Convention, several yellow-green, and considerable in the dark green. The railway excursions will be made to a number of action of eosin is strongest exactly where the action of points of engineering interest in Colorado. These chlorophyl is weakest; it gives about the same degree excursions have not yet been fully arranged, but of sensitiveness to yellow-green that chlorophyl gives will provably include -treeley and the extensive to red, but in a broader band. The violet sensitiveness irrigation works in its vicinity, Georgetown, Leadto be exactly the same as in an unstained ville, Gunnison, and Pueblo. It is proposed that they shall terminate at Colorado Springs, where the engineers will separate for their respective homes. A remarkable result of all. Neither sensitizer appears to large attendance is anticipated, and in consequence very favorable transportation rates have been secured. Mr. Henry Flad, the President of the Society, will graph below F is stronger than the strongest portion in deliver the annual address during one of the sessions of

we believe the highest returns Omaha, Nebraska, where a company, operating four plate. 30 light dynamos, had earned at the end of the first three months after incorporation 4½ per cent on the investment, or at the rate of 18 per cent per annum. Two more dynamos of the same capacity have since been added to their plant. The gentlemen connected with this company are so well pleased with these results that they procured a franchise for operating in Des Moines, Iowa. They began by running 65 arc lamps, but have since increased their plant.

Replies have also been received from Washington, St. Louis, Worcester, Terre Haute, Auburn, Me. Salem, Mass., Quincy, Ill., Kansas City, etc., which confirm these results, and state emphatically the belief of the writers in the desirability of electric lighting as an investment.

These conclusions, although derived from the working of the particular lighting system we have named,

The chlorophyl-eosin plate shows by far the most have retarded the action of the other, but rather to have aided it, so that the weakest portion of this photothe blue and violet! Nearly a year ago I recommended the Convention.

that chlorophyl and eosin be used together in practical isochromatic photography, and this experiment proves that the combination possesses the advantages which I claimed for it.

I have found that, in order to secure the best results with the chlorophyl-eosin process, fresh, strong, bluemyrtle chlorophyl solution must be used, and the amount of eosin must be strictly limited, otherwise, the plate will not be so sensitive to vellow and to bluegreen. I now prefer to apply the eosin by simply tinting it with water in which the plate is to be washed, after may be equally valid and reliable for other systems applying a plain solution of chlorophyl. I have an 1860-65 having been numerous,

DAVID VAN NOSTRAND, a well known New York publisher and importer of scientific books, died June 14, in the 75th year of his age. He was first employed in a city bookstore when 15 years old, and subsequently became acquainted with many military and scientific men, who gave him orders for books, relving upon his good judgment for their selection. He thus, as well as from the natural bent of his tastes, developed a business especially in the line of military and scientific books, his military publications during the war of
