sawdust, and burnish the parts required to be bright; mortar. Bank around the outside with forge ashes or pint. The pulley or rim should be made perfectly free after which, the surface can be lacquered with clear shellac varnish. We do not recommend this for ama teur practice. It requires some experience to bring out the work clear.

- (4) B. A. asks for directions for making the composition for selfinking pad for rubber stamps. A. The usual composition consists of, 2 to 4 drachms aniline, of desired shade. 15 ounces alcohol and 15 ounces glycerine. The solution is poured on the cushion and rubbed in with a brush. Another formula includes 1 part gelatine, 1 part water, 6 partsglycerine. and sufficient coloring matter.
- (5) W. M. asks (1) how to make a good root beer, similar to Hier's. A. Take 10 gallons water, heat to 60° Fah., then add 3 gallons molasses, let it stand two hours, ponr it into a bowl and add powdered add water enough to make 25 gallons in all. Ferment cherry floor stain. A. Take rain water 3 quarts, annatto nut, keep it on the fire for half an hour longer, then
- (6) L. P. asks (1) how prepared gypsum for calcimining and whitening is manufactured. What is the best and cheapest way to pulverize the gypsum formaking plaster of Paris, also the best way for calcining it? A. It is ground between burr stones until it is reduced to a fine powder. This is calcined by being heated in kettles or stills, the escaping water producing a movement like ebullition, 2. How can I test lime rock to tell whether it will make hydraulic lime or not? A. By testing for silica. To be a good hydraulic cement, must contain at least 10 per cent of silica. A. 3. What is red pipe clay good for? Will it make paint if ground fine? A. Any colored oxide mixed with linseed oil can be used used as a paint, but if it requires too much oil, then it is practically valueless. Pipe clay can be used for the cheaper grades of pottery.
- Take of litharge 20 parts and 1 of burnt lime in fine, dry powder. Make into a putty with linseed oil,
- (8) W. C. V. asks a recipe for a good 1 quart of clear rain water, and add 1/4 ounce of oxalic acid. A teaspoonful of this is sufficient for a large washing.
- (9) R. S. S. H. asks: What can be done to renovate and brighten the gilt frames of pictures and mirrors that have become rusty and dingy? A. small sponge moistened with spirits of wine, or oil of turpentine, the sponge only to be sufficiently wet to take off the dirt and fly marks. They should not be wiped afterward, but left to dry of themselves.
- a recipe for a laundry marking ink which will not wash sion, and should then be thrown away. Keep the bottle or bleach out in the ordinary way of washing, and will of mixed developer well corked. The solution will flow freely from the pen, and will not need any preparation for setting it in either heat or chemical, but will be indelible from the minute it is put on the goods? A. Dissolve with the assistance of heat, 20 parts of brown shellac in a solution of 30 parts of borax in 300 to 400 parts of water, and filter the solution while hot. Then add to the filtrate a solution of 10 parts of aniline black soluble in water, three-tenths parts of tannin, one-tenth part of picric acid, 15 parts of spirit of sal ammoniac, and one-quarter ounce of water. To purify water see e "Purification of Drinking Water by Alum," contained in Scientific American Supplement, No. 491.
- (11) H. L. H. asks if there is anything which will positively remove large moth patches or freckles from the face, without injuring the skin. A. There is probably nothing known that will positively eradicate freckles. Among the many cures recommended, the following has the merit of being harmless: Dissolve three grains of borax in 5 drachms of each. rose water and orange flower water.
- (12) W. V. B. writes: I have quite a little silver dissolved in a solution of cyanide of potassium, which has been used for electroplating. How can Pour a pint of boiling water upon 2 ounces of gum it be pure enough for photographic purposes? A. Precipitate with the battery and dissolve in nitric acid.
- (13) F. K.—Asphaltum is the only gum
- (14) E. H. S. & Sons ask how glass is silvered. A. For this purpose a large, perfectly flat stone table is provided. Upon it is evenly spread a sheet of tin foil without a crack or flaw. This is covered uniformly to the depth of 1/8 inch with clean mercury. The and water. plate of glass, perfectly cleansed from all grease and impurity, is floated on to the mercury carefully, so as loading it with weights, in order to press out all the It is japan varnish. 2. A liquid to apply to a rubber mercury which remains fluid, which is then received in coat which has been so damaged by heat that it is not a gutter around the stone. After about twenty-hours it waterproof? A. Coat it with a solution of rubber disis raised gently on its edge, and in a few weeks it is ready to frame.
- (15) L. T. S. asks for a liquid glue containing no acid. A. Liquid glue may be made by dissolving glue in nitric ether. The following formula is stated to be very good: 1 part sugar is dissolved in warm water, 14 part slaked lime is added, it is kept at lampblack; add 4 ounces beeswax for use in summer 1459-1659 Fah. for somedays, with occasional shaking. and is then decanted. 1 part of glue is dissolved in 4 or 5 of above clear solution, to which 2 to 3 per cent of glycerine and a few drops of lavender oil are to be
- '(16) W. A. P. asks the cheapest, simplest, and most practical way for an amateur to make a furnace to melt from 5 to 10 pounds of brass for casting. A. You can easily melt 5 to 10 pounds of brass in a blacksmith's forge. Use a blacklead crucible of the proper size. Build a fire chamber around the tuyere 214 times the diameter of the crucible, with fire brick, or common brick if you have no fire brick. Use no

cinder. Set the crucible 4 or 5 inches above the tuyere on the fire and fill in all round, and cover with a large while melting, to keep it from oxidizing. Blow the charcoal off with a hand bellows when ready to pour.

(17) A. M. M. has a quantity of spoiled dry plates, and asks how to save the silver in the films. A. To recover the reduced silver, first get off the gelatine film by immersing the plates in a weak solution of hydrofluoric acid and water, dropping each film, as it is easily pulled off the glass, into a deep porcelain evaporating basin. Cover the films with hot water, then add or bruised sassafras and wintergreen bark, of each 2 a few crystals of common washing soda sufficient to pounds, yeast 1 pint, bruised sarsaparilla root 1/2 pound, make the solution alkaline, bring it to a boil, and stir well until the gelatine in the films is dissolved. No for twelve hours, then bottle. 2. How to make a change of color will be observed until a small quantity of sugar is added. Then the solution first turns gray, 4 ounces, boil in a copper kettle till the annotto is disbrown, and finally black; continue the boiling for 15 solved, then put in a piece of potash, the size of a wal. minutes. Rest the solution for a few minutes, then extract a little of the black sediment in the bottom and test its solubility in nitric acid. If it does not dissolve completely, continue the boiling for half an hour, adding a little more washing soda. When it is found to readily dissolve in nitric acid, then pour off the brown colored supernatant fluid, and replace with water. Stir up the sediment so it may be well washed, and allow the sediment to settle. Continue washing in this way two or three times until the supernatant water is quite clear. Then the mass of silver sediment is converted into nitrate of silver by the cautious addition of dilute nitric acid. If the same is added too rapidly, the frothing up of the mixture is liable to cause loss of silver. When the sediment is all dissolved, we have a solution of nitrate of silver, which should be evaporated to dryness over a sand or water bath. Afterward the crystals may be redissolved for use in making silver solutions. While useful, more especially for emulsions, this process may be used for films. 2. Why do ferrotype plates have a blu (7) F. B. desires a good receipt for ish color when taken out of the sensitizing silver bath? stopping a crack or small hole in a large sink. A. A bluish film is due to a bath too strong for the collodion, too cold a temperature of the bath, or because it is a new bath resufficiently iodized. A single solution for developing dry plates that will keep may be liquid blueing for laundry work. A. Take I ounce of made as follows: Sulphite sodium (chem. pure) cryssoft Prussian blue, powder it and put in a bottle with tals 4 oz., warm distilled or melted ice water 6 oz.; when cooled to 70° add sulphurous acid water (stronges strength obtainable) 3 oz., pyrogallol 1 oz., carbonate of potash (chem. pure) 11/4 oz. The weights are avoirdupois, or 437 grains to the ounce. Place one and a half drachms of the above solution in a graduate, and fill with water up to two ounces, then pour the developer over the plate. Development should commence You may improve them by simply washing them with a in less than a minute. In case the plate is underexposed, add half a drachm of the solution at a time, until the development proceeds faster. If the image flashes out quickly from overexposure, dilute the developer at once with a large quantity of water. The (10) H. C. D. writes: Can you give me developer may be used on three or four plates in successi work welf as long as it is not thick and muddy.

- (18) G. P. S. says: May we ask you to state in your paper the greatest distance which a projectile has been thrown from any gun-cannon-now manufactured? A. We believe the greatest range attained has been by means of the De Bange cannon-11 miles.
- (19) J. F. M. asks if an iron or steel bushing one-eighth of an inch thick, made to drive in a brass hole, would have a tendency to get loose by heating to a cherry red heat, or could a brass bushing be used in an iron hole? A. The bushing will not remain tight after heating. The brass expands more than the iron, as 3 to 2. If the brass is inside the iron, it will be quite loose. If an iron bushing is driven in brass, it will be moderately tight after heating, because the brass expands away from the iron by heating and re turns into contact by cooling.
- (20) A. S. asks what material is used in laundrying cuffs and collars, to make them so glossy. A. The simplest preparation consists of the following: I obtain the silver either as a nitrate or chloride, and will arabic, cover it, and let it stand overnight. Use a tablespoonful of this.
- (21) A. M. desires (1) a receipt for a good cheap liquid stove polish. A. See answer to query 5 we know of that will withstand the action of nitric acid. in Scientific American for November 12, 1887. 2. A preparation that will remove moss dirt and discolorations from marble. A. Mix quicklime with strong lye, so as to form a mixture having the consistency of cream. Apply it immediately with a brush and allow to remain for a day or two, and then wash off with soap
 - (22) J. S. K. asks: 1. What is the comsolved in carbon disulphide. See the article on this subject in Scientific American Supplement, No.
 - (23) R. M. D. asks a receipt for making harness grease. A. Try the following: 1 quart neat foot oil, 4 ounces beef's tallow, and 3 tablespoonfuls
 - (24) O. J.—See Notes and Queries, No. 4. May 28, 1887, and No. 17 March 12, 1887, about polishing agates, geological specimens, etc.
 - (25) J. A. G. asks how to manufacture metallic paint from magnetic iron ore. A. The ore may be ground, dried, and mixed with linseed oil.
 - (26) J. B. R. wishes (1) a receipt for a cement for putting a leather facing on an iron wheel nothing better for gluing leather to iron than good tough glue with a dozen drops of glycerine to the half

from oil and dirt and the face thoroughly scratched over with a file. Then treat with nitric acid 1 part, water 1 piece of charcoal. Put in the metal after the fire is part, for a few minutes, to deaden the surface. Wash started. Keep the crucible lifted to its proper place as with hot water to free the surface from acid. Scarf one the fire settles. Do not blow too hard, nor heat the end of the leather band; glue and draw tightly around metal so hot as to boil it, which makes it spongy. Use the rim, lap the thick end over the scarf and clamp. a little powdered charcoal on the surface of the metal; Afterward trim the surface even. 2. A receipt for a cement for putting a wood veneer face on an iron saw table. A. The same kind of glue is the best for veneer on iron, but nothing will withstand the ultimate shrinking of wood on iron, it is too rigid; better make the saw table facing thick enough to put on with flat head machine screws.

- (27) D. & H. ask the process and how to make solution used to color bronze hinges, locks, etc., a rich brown, the color of confectioner's chocolate. A. For a dipping brown, use to 1 pint of water 5 drachms perchloride of iron. The articles must be made perfectly clean and dipped in the hot solution until the required color is obtained; then dipped in clean hot water, dried, and lacquered. If only a varnish is required, use clear shellac varnish colored with dragon's blood, gum, and burnt umber.
- (28) G. V.—For painting tin roofs use ed oxide of iron (Prince's metallic paint) mixed with boiled linseed oil. Temper the color with lampblack if a darker color is required, or with white lead for a lighter color. If necessary to facilitate spreading with the brush, add a little spirits turpentine. This paint is tough, holds well, and if neatly done looks well. Coal tar paints are sometimes used, but are liable to chip in cold weather.

TO INVENTORS.

An experience of forty years, and the preparation of more than one hundred thousand applications for patents at home and abroad, enable us to understand the laws and practice on both continents, and to possess unequaled facilities for procuring patents everywhere. A synopsis of the patent laws of the United States and all foreign countries may be had on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices, which are low, in accordance with the times and our extensive facilities for conducting the business MUNN & CO. office Scientific American, 361 Broadway, New York.

INDEX OF INVENTIONS

For which Letters Patent of the United States were Granted

November 22, 1887,
