revelations of the examination as to the small amount | by reducing the grate and urging a still stronger fire. of wages earned by immensely long hours of work are It is where the boiler is of larger capacity than the well if its contents were read and studied by all who have a direct or indirect interest in the cause of the

THE CHEMICAL ANALYSIS OF IRON. complete account of all the best known methods for the analysis of stone, steel, pig iron, iron ore, lime-stone, slag, clay, sand, coal, coke, and furnace and producer gases. By An-drew Alexander Blair. Philadelphia: J. B. Lippincott Co. 1888. Pp. 282.

This excellent treatise is devoted primarily to the analysis of metallic iron; this is given in detail with all the determinations and the different methods of effecting them. The analysis of iron ores is treated in a special chapter, and then the analysis of allied substances is spoken of, such as limestone, clay, slags, fire sands. coal. and coke. and furnace gases. A chapter of tables giving atomic weights, factors, etc., concludes the work. It is very well illustrated by nearly 100 cuts of apparatus, and a satisfactory index is given. It can be recommended, not only on account of its author's high reputation, but also on account of its contents, to all chemists interested in the analyses of blast furnace and rolling mill and steel works material.

SPECIAL REFERENCE TO THE RUSSELL PROCESS. By Carl A. Stetfeldt. New York: Published by the author, 18 Broadway. Pp. xx, 234.

The title of this book discloses its nature. It is in effect a very extensive and elaborate monograph, and one which will undoubtedly be of value to all who are specially interested in this process. It is illustrated by a number of cuts showing the different apparatus entployed in the process treated of, while many figures, tables of results, etc., contained throughout the work add largely to its value. It is indexed, and the cuts already alluded to-thirty in number-embodied in the text are supplemented by several folding sheets showing the arrangement of different portions of the lixiviation plant treated of in the work.

RAILROADS AND ROLLING STOCK. A catalogue giving cost of plant and material for portable, light, and main lines, to which is added a chapter on river steamers and light craft, also dredging plant. Prepared by John Birch & Co., engineers and merchants, Liverpool. Pp. 232.

All that can be said of this catalogue is that it describes, notes, or illustrates almost everything that can be thought of under its title. Although a trade cata logue, it forms a very convenient and attractive manual for those interested in railroad and machine engineer-

# HINTS TO CORRESPONDENTS.

Names and Address must accompany all letters, or no attention will be paid thereto. This is for our information, and not for publication.

References to former articles or answers should give date of paper and page or number of question. Ruquirles not answered in reasonable time should be rejeated; correspondents will bear in mind that some answers require not a little research, and, though we endeavor to reply to all, either by letter or in this department, each must take his turn.

Special Written Information on matters of personal rather than general interest cannot be expected without remuneration.

Scientific American Supplements referred to may be had at the office. Price 10 cents each. Books referred to promptly supplied on receipt of

Minerals sent for examination should be distinctly marked or labeled.

- (1) G. F. asks how to make a good flash light for photographic purposes. A. Purchase one ounce of magnesium powder and one ounce of negative gun cotton from dealers in photographic materials. Place on a dust pan enough cotton, when pulled out, to measure about 316 inches in diameter. Sprinkle it over with twenty grains of magnesium powder to form a thin, even film. Lay over the magnesium thus arranged a very thin layer of gun cotton. Connect to the bunch of cotton a small fuse of tend to the side of the dust pan. Then set the pan on a step ladder near the object, and when ready, light the to one side. A. Use bicycle tire cement, or disand lamps to fire them.
- (2) J. C. asks for a receipt for removing mildew from white silk. A. Perhaps naphtha will do it. Take to dve house, or try following: Dip a piece of fiannel in alcohol and water, and well rab the place; iron on wrong side, putting a piece of damp cotton cloth between the iron and the silk.
- (3) E. F. Co. write: We recently noticed an article in Scientific American upon the subject of size of fire box under boilers to give best results, and stating that the fire boxes are usually too and want to ascertain what size our grate between door and bridge wall ought to be under our boiler, 13 feet 6 inches long. 5 ft. diam., 84 tubes 216 inches, steam pressure required 80 pounds. A. The amount of grate surface required for your boiler is dependent upon the boiler with large grate surface can only keep up the steam required by strong firing, there is nothing gained brush.

very sad. It is published by the State, and it would be steam requirement that the gain is made by reducing the normal grate surface to the proportions mentioned in the article alluded to. Really, the great economy is madein having the boiler at least 50 per cent larger than the steaming capacity required, as usually computed. Then with a reduced grate surface and quick fire the utmost economy will result. The whole gist of steam economy is in saving the waste heat of the chimney and the exhaust. Of course proper care must be taken to prevent loss of heat from exposure of steamheated surfaces around boiler, pipes, and cylinder. Before we can advise a reduction in your grate, should know the temperature of the gases of combustion as they leave the heating surface. The difference between this temperature and the temperature of the steam will indicate the waste. Also, we should know if the present firing is strong or dull; it being a most important factor in making a change foreconomy to know the relative proportion of heating surface in the boiler to the amount of steam produced or work done. It is a mor common practice to urge a boiler to excessive duty and then complain of excessive coal consumption. We can only advise that, if you desire to make an experiment of any real value, you accurately weigh the fuel used for a day, or h tter for a week. Then put a row of fire brick on each side of the grate, three or four bricks high, making your actual grate surface 9 inches narrower. By urging the fire with the THE LIXIVIATION OF SILVER ORES WITH fuel weighed as before for a definite time-a day or preferably a week if you can—you may have an absolute test of the economy of the change in your case. If you succeed, your boiler is large enough for your wants. If not, the couclusion is that for economy you should have a larger boiler. The art of firing is an essential feature in steam economy, too often overlooked in the complaints as to fuel consumption. A difference of per cent or more may be made by variation in the management of doors and dampers

(4) P. I. J. asks: 1. Can a wine artificial in its make-up, or that has been colored or improved by ethers, be easily distinguished from a natural wine? A. It is sometimes very difficult to do. The aniline colors are tested for, and special tests applied for susthe various fruit ethers be obtained? A. These have to be studied in chemical treatises. There is no work devoted exclusively to them. 8. In making a vanilla extract, difficulty in completely pounding the bean to a pulp iu a mortar is experienced. Can you tell an efficacious method? A. Add white sand, and pulverize sand and beans together. 4. Are there any special colognes that are made, usually by simple solution of the oils in the cologne spirits, that would be improved on distillation? A. We know of none, 5, Which would make the best emulsion of wax-Castile soap or caustic potash? A. Neither will answer. Try dissolving the wax in oil and making an emulsion of the product with water and gum tragacanth.

(5) G. A. J. asks: 1. What is used for a gold bronze for wood, and how applied? A. The preparation is sold as a powder, and is applied mixed with a suitable varnish, or the surface is first varnished and the powder applied with a pad while the varnish is still tacky. 2. Does the use of mica oil in boilers lessen the heating capacity? The oil is used for the prevention of scale, etc. A. Not to any appreciable extent, unless used in large quantities. The boiler should be blown off from time to time. There is some danger of corrosion. 3. How to sugar-cure beef. A. Cure for 10 or 12 days with dry salt to which a little saltpeter has been added, along with some sugar and black peoper. It is then hung up until required. Folded in dry paper and hung in a dry place, it will keep two or three months. 4. Is there any way to temper brass wire after it has been hot? A. Light hammering, redrawing to a slightly smaller size, heating followed by a very slow cooling, all tend to harden brass. 5. What is the price of platinum, such as used in wire, etc.? Is it used as coin in some countries? A. \$9.00 an ounce. It has been used in Russia for coinage.

(6) C. G. H., of Wallingford, Conn., sends two worms found on a snowball bush. When they touch the hand, he says, it is badly nettled and inflamed for a few days. What is it? A. Professor C. V. Riley says they are larvæ known commonly as saddle-backed caterpillars. They are the larvæ of a moth known as Empretia stimulea, which is comparatively common almost all over the country. The larvæ feed upon a great variety of plants, but are perhaps found more often upon corn than upon anything else. They belong to the group of stinging caterpillars, and the effect of their spines upon the skin is similar to that of a nettle.

(7) A. S. E. asks (1) how to deodorize wood alcohol to fit it for burning? A. No efficient and twisted cotton about six inches long, so that it will ex- cheap way is known. 2. What cement will secure wood firmly to glass, same carried by wheel applied gun cotton fuse with a match, when instantly a brilliant solve 1 part India rubber in 12 parts benzine and add fiash will ensue. There are several ready prepared 20 parts of shellac and carefully heat until benzine is magnesium compounds now sold with special devices expelled. There is much danger of the benzine igniting. 3. How to make the aniline colors, getting them in the crystal forms. A. You can buy aniline colors from the dealers in chemicals.

> (8) W. B. K .- The terms "cold-blooded" and "warm-blooded," as applied to human beings, refer principally to the excitability or non-excitability of the individual, and not really to any difference in the heat of the blood. The temperature of the heart circulation in all persons in health is about 98° Fah.

(9) I. A. C. desires a receipt to make marking ink, black and red either or both, to mark cotlarge. We have suspected that we used too much fuel, ton bales and sacks. It must be cheap, as we sell by the barrel. A. Take of shellac 2 parts, borax 2 parts, water 25 parts, gum arabic 2 parts, and of either lampblack. Venetian red, or ultramarine a sufficiency. Boil the borax and shellac in water till they are dissolved, and withdraw from the fire. When the solution amount of steam required, which you do not mention. has become cool, complete 25 parts with water and add The article in question alludes to the construction of the coloring matter to bring the ink to sultable consistboilers of full capacity for the work to be done. If a ence. When it is to be used with a stencil, it must be made thicker than when it is to be applied with a

(10) T. R. M. asks a formula for chargng Babcock's fire extinguisher. A. The extluguisher is charged with a solution of bicarbonate of soda in water and sulphuric acid in a glass bottle, the latter, when required for use, being crushed with a screw, spilling the acid into the charge of soda and water. Carbonic acid gas is instantly generated, by which a pressure is obtained sufficient for throwing the whole contents of the apparatus with much force through a nozzle for fireextinguishing purposes.

(11) J. E. L. Co. asks how to cleanse sponges of the sand and white particles found in them as they are sold by the trade. A. Shake and wash, with a little hydrochloric acid in one of the wash waters

(12) C. W. B. asks the quickest and cheapest way of putting a fine polish on light-colored woods, such as white holly, etc. A. Rub paraffine on and polish with a white woolen cloth. Mastic varnish is suitable for white holly. Also, bleached shellac makes a good varnish, using 95 per cent alcohol for so-

(13) D. N. desires a receipt for making mocking bird food. A. Mix together 2 parts corn meal, 2 Darts Dea meal, and 1 Dart moss meal (made by dry, ing and grinding the imported German moss seed), add a little melted lard, but not sufficient to make the mixture too greasy, and sweeten with molasses. Fry in a pan for 1/2 hour, stirring constantly, and taking care not to let it burn; this makes it keep well.

(14) G. H. P. and others.—When a locomotive is drawing a train around a curve, the outside drivers slip backward. When running by momentum only, the slip may be on either side, depending upon the surface condition of tracks or treads, and also upon excess of weight thrown on outer wheels by centrifugal refer due to relacity and smallness of curve. When braking up or with reverse steam on curves, the slip is forward on the inner wheels.

(15) J. M. B. asks: Is there any method of giving to the surface of an iron stove a copper or bronze luster that will not be destroyed by the heat, or that could be cheaply renewed from time to time? A. There is nothing in the paint or polish line but plumpected adulterants. 2. Where may a full account of bago stove polish that will stand the heat. Nickel plating is much used now for ornamenting stoves

### TO INVENTORS.

An experience of forty years, and the preparation of more than one hundred thousand applications for patents at home and abroad, enable us to understand the laws and practice on both continents, and to possess unequaled facilities for procuring patents everywhere. synopsis of the patent laws of the United States and all foreign countries may be had on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices, which are low, in accordance with the times and our extensive facilities for conducting the business. Address MUNN & CO., office SCIENTIFIC AMERICAN, 361 Broad-
