

Scientific American.

ESTABLISHED 1845.

MUNN & CO., Editors and Proprietors.

PUBLISHED WEEKLY AT

No. 361 BROADWAY, NEW YORK.

O. D. MUNN.

A. E. BEACH.

TERMS FOR THE SCIENTIFIC AMERICAN.

One copy, one year, for the U. S. or Canada, \$3 00
 One copy, six months, for the U. S. or Canada, 1 50
 One copy, one year, to any foreign country belonging to Postal Union, 4 00
 Remit by postal or express money order.

Australia and New Zealand.—Those who desire to receive the SCIENTIFIC AMERICAN, for a little over one year, may remit £1 in current Colonial bank notes.
 MUNN & CO., 361 Broadway, corner of Franklin Street, New York.

The Scientific American Supplement

Is a distinct paper from the SCIENTIFIC AMERICAN. THE SUPPLEMENT is issued weekly. Every number contains 16 octavo pages, uniform in size with SCIENTIFIC AMERICAN. Terms of subscription for SUPPLEMENT, \$5.00 a year, for U. S. and Canada. \$6.00 a year to foreign countries belonging to the Postal Union. Single copies, 10 cents. Sold by all newsdealers throughout the country.

Combined Rates.—The SCIENTIFIC AMERICAN and SUPPLEMENT will be sent for one year, to any address in U. S. or Canada, on receipt of seven dollars.
 The safest way to remit is by draft, postal order, express money order, or registered letter.

Australia and New Zealand.—The SCIENTIFIC AMERICAN and SUPPLEMENT will be sent for a little over one year on receipt of £2 current Colonial bank notes.

Address MUNN & CO., 361 Broadway, corner of Franklin Street, New York.

NEW YORK, SATURDAY, JANUARY 26, 1889.

Contents.

(Illustrated articles are marked with an asterisk.)

Amber fishers of the Baltic	52	Notes and queries	57
Anthony, Edward	49	Observatory bldg., Univ. of Va.	55
Appliances, railroad	57	Observatory, McCormick, at University of Virginia	55
Business and personal	57	Paper, chloride, details for work	53
Caster, safety, Sullivan's	51	Photograph from barometric	53
Colors in nature, contrast of	51	Photography, instantaneous	50
Comet, Brooks No. 1 of 1883	53	Physics, simple experiments in	54
Cranes, Heroules, revolving	53	Planets, positions in February	49
Dangers, electrical, in New York	53	Porter, chain, Pitt's	50
Death, dread of	49	Rabies, treating	56
Draughtsman, the	52	Rats	49
Engines of steamer Connecticut	47, 56	Replies to enquiries	59
Engines of Connecticut, valve motion and connections	56	Schultz, Mile	54
Enquiries to be answered	59	Ship, war, largest	50
Gas apparatus, McCollum's	51	Spectrum app., diagram of	54
Goats, A. African	51	Spectrum, app. for producing	54
Ink rains	52	Spring, vehicle, Thomas	51
Inventions, engineering	57	Steel, tempered, experiments with	54
Inventions, index of	57	Tornado, recent, in New York	49
Inventions, mechanical	57	Trade mark, selecting, hints on	53
Inventions, miscellaneous	51	Vesuvius, trial trip of	56
Iron, wear, for vehicles, Gedney's	51	Waves, oiling the	51
Lawyers, ways of	54	Woods, relative hardness of	49
Neptune, satellite of	53		

TABLE OF CONTENTS OF SCIENTIFIC AMERICAN SUPPLEMENT No. 682.

For the Week Ending January 26, 1889.

Price 10 cents. For sale by all newsdealers.

I. BIOLOGY.—Yeast—Its Morphology and Culture.—By A. GORDON SALAMON.—A continuation of this important biological study, with tabular statement of experiments and diagrams of yeast formations. 12 illustrations.	10898
II. CHEMISTRY.—On the Decomposition of Acetone with Bleaching Powder and Water, and the Reaction.—A very important commercial process, making possible the production of chloroform without alcohol, fully described with all the reactions. On the Influence of Light upon the Explosion of Nitrogen Iodide.—Note by Prof. J. W. MALLER upon the influence of actinism on the decomposition of this compound. Excretion of Sulphuric Acid.—Interesting examination of the elimination of sulphuric acid from the human system.	10901 10902 10902
III. ELECTRICITY.—An Inexpensive Cell for Galvanism.—By A. H. BUCKMASTER, M.D.—A very simple method of constructing an electric battery. Electric Traction at the Stassfurt Mines.—Interesting application of electric traction in a mine.—The famous Stassfurt salt mines and the electric plant for operating the mine cars.—2 illustrations. Electric Water Indicator and Recorder.—An automatic telegraph for indicating the changes in water level at a distance from the reservoir or tidal station.—10 illustrations. Electric Welding.—An interesting account of a recent test and experiments on Prof. Thomson's process of electric welding, and the result of trials of strength made at the Watertown Arsenal.—2 illustrations. Report on the Examination of Lightning Conductors.—By GUSTAV KRISCH.—A model investigation of the efficacy of protection afforded by lightning conductors in the case of a theater and municipal building in the city of Oldenburg. Sir David Salomons' Resistance Governor.—A machine for regulating resistance in case of variation of electromotive force.—The two forms of the apparatus illustrated and described.—2 illustrations. The Telephone, the Microphone, and the Gramophone.—By DAS TELEPHON.—Notes on the three speaking electrical inventions and on early inventors in the same line of work.	10894 10895 10894 10893 10895 10893 10892
IV. ENGINEERING.—The American Institute of Mining Engineers.—Review of the proceedings of the Institute at their recent Buffalo meeting, with illustrations of localities visited by them, and list of papers read.—6 illustrations. Traction of Boats by Cable.—Interesting application of cable traction for canal boats, with full details of its application in experiments conducted upon actual boats on a French canal.—5 illustrations.	10888 10887
V. MEDICINE.—The Influence of the Discovery of Cocaine upon Ophthalmic Surgery.—How the treatment of the diseases of the eye has become simplified by the use of local anesthesia.—The after treatment of the eye as influenced by cocaine.	10895
VI. MISCELLANEOUS.—Exposure of M. Pasteur's Methods.—An energetic attack upon Pasteur, with abstract of his discoveries and their effect upon the world's history. Note on the Annual Expenditure on New York's Private and Public Hospitals. The Indian Basket.—Full account of the famous Indian basket trick, with illustration of the basket employed in producing the illusion.—1 illustration. Yucatan, the Cradle of Man.—Interesting note of explorations in Yucatan and of discoveries made there.	10900 10901 10901 10900
VII. PHOTOGRAPHY.—Color Sensitive Collodion Emulsion Equal in Rapidity to Gelatine Plates.—Interesting experiments with dyed collodion films and comparison of the same with gelatine plates, with formulae. Photographic Engraving on Glass and Other Applications of Fluorine in Photography.—A most interesting application of photography in the production of designs permanently etched upon glass objects, with full practical details.	10891 10892
VIII. PHYSICS.—An Experimental Lecture on Flame and Smoke.—By THOS. FLETCHER.—A most interesting account of a lecture, with experiments, by this leading authority.	10890
IX. PHYSIOLOGY AND HYGIENE.—A Few Hints about Drainage.—By F. W. CHAMBERLAIN.—Practical notes on draining houses and on the selection of their sites, methods of securing a dry cellar, etc. The Gases of the Blood.—By Prof. JOHN GRAY MCKENDRICK, M.D.—Continuation of this important paper, treating especially of the reaction between the blood and oxygen and of the effects produced by oxygen absorption.	10897 10896
X. TECHNOLOGY.—Bookbinding.—A graphic account of the bookbinders' art abstracted from a lecture given at the Arts and Crafts Exhibition, London. Improved Gas Producer.—A fuel gas plant of great simplicity of construction, with results obtained by its use.—1 illustration. Improvements in Lime Kilns.—A mechanical and automatic lime kiln, providing for continuous burning and production of lime.—4 illustrations. Influence of Water upon Wool.—The influence of water upon wool in its manufacture, the influence of heat and purity of water upon its action.	10890 10891 10891

AN ELECTRICAL COURSE AT COLUMBIA.

Columbia College, New York, has decided to have a special course in electrical science, and not a moment too soon, for this has long been seen to be a department by itself, and, while allied to other branches of natural philosophy, requiring, at least from those who would adopt it as a profession, an undivided attention. Because of this it is to be made a post-graduate course of one, two, or three years, thus allowing those who have completed the rudimentary studies in electricity and magnetism in the School of Mines, and outsiders with elemental experience, to continue their studies. The proposed course will consist in practical work, construction of lamps, dynamos, primary and secondary batteries, insulation and installation of the plant, and, of course, investigation of the phenomena of electricity.

There is that called "theory" and that called "practice," and while one may be had without the other, no man may justly consider himself an electrician who is not familiar with both. In all the large electrical shops, as in the engineering ones, experience has been had with men schooled only in the theory of their work, and though it is an invaluable capital to commence practical work with, it has not been found infallible in the making of a first rate workman, while in some shops they prefer a slight acquaintance with practical work, if the man is intelligent and industrious, to a deal of theory where the latter is allied with over-confidence. On the other hand, it is hard to find a shop-bred man, let him be ever so skillful, who does not sorely regret his lack of theoretical knowledge. Few such men can draught their own designs or make their own calculations; often witnessing phenomena while experimenting, or during the course of their labors, which, were they read in the natural laws, those that have been formulated, they could perhaps appreciate and reproduce.

A workshop, laboratory, and lecture room such as it is designed to place at the disposal of the electrical department of Columbia College, ought to be sufficient to turn out men capable of original investigation; men at least capable of taking a responsible position in the practical work in the mercantile field; who can design and work or superintend work from their own drawings. In a practical age like this, that would seem to be the most valuable college instruction which most nearly resembles what its recipients are looked to to accomplish outside of it.

A NOVEL EXPERIMENT WITH CRIMINALS.

The report of the Elmira Reformatory, now eight years in operation, will be found worthy the attention of the scholar, as well as that of the humanitarian. It shows, so far as so limited an experience can be relied on, that the contamination of a penitentiary tends to encourage those to adopt careers of crime who are not naturally vicious, and, *per contra*, that education and the absence of vicious surroundings serves, at least in the case of first offenders, to wean them from the course they have only just set out upon. It says that 60 per cent of the convicts released from other prisons find their way back again, while, thus far, 80 per cent of those discharged from the Elmira Reformatory, during the eight years of its existence, are believed to be permanently reformed and engaged in honest labors.

It must be remembered, while considering this statement, that only first offenders are admitted to the Reformatory, while into the ordinary State's prisons come the old criminals, from whom little or nothing can be hoped. But it has been set down as a rule: "Once a criminal, always a criminal," that those who have served one term in a penitentiary are likely to return; the prison authorities infer this where they do not say so in their reports, and the statistics they give seem to confirm the statement. At the Reformatory the system of discipline is wholly different. The terms of confinement, however long, may be remitted by the board of managers after one year's incarceration.

A regular system of instruction is maintained; the prisoners devoting themselves to studies which will the better enable them to be self-supporting; the fact that good behavior, attention, and industry will free them quickly, and that they have yet a chance to go on again without the stigma that always attaches to those serving a term in the penitentiary, encourages those with the least spark of intelligence; nor does intellectual development, as has been alleged, increase the capacity for wrong doing. At least the authorities of the Reformatory say they have not found this to be the case.

DANGEROUS FLAT HOUSES.

The London *Lancet* sees a menacing danger in the present system of living in large flats, save when unusual caution is observed in drainage inspection. It says that persons so living are at the mercy of the janitor, though to the lay mind it seems obvious that they would be still worse off without one. If he is ignorant or neglectful in the matter of the drain pipes, "the whole house may be rendered unhealthy." But if

such should happen, the occupants would leave, the house get a bad name, and its owner lose money. Hence, happily, it is to the interest of the owner to employ an efficient janitor and to see that he attends to his duties.

The suggestion that those about to rent a flat should, as a preliminary, employ a physician to investigate its sanitary condition, has, of course, much to commend it, while, at the same time, a precaution that those of very moderate means, dwelling in the poorer, and, perhaps, for that reason, the most scantily protected flat houses, are not likely to take. So far as New York flat houses are concerned, the Board of Health reports them to be fairly well aired and drained, and has not, as yet, found reason because of any prevalent disease to discriminate between those above the rank of common tenements and the expensive "apartment" houses. The *Lancet* goes on to say: "If the main drain is not both water-tight and so disconnected with the sewer as to admit of a free current of fresh air through its entire length, we have no hesitation in asserting that the risk of living on the premises is a substantial one, and that it is increased by reason of the multiple occupation which always occurs in the case of flats."

A medical inspector of the New York Board of Health being shown this, said, substantially: "So far as New York flat houses are concerned, such private inspection as is here suggested is scarcely necessary. By the rules established by the Board, each apartment must be furnished with trap and siphonage of its own, and as each of these is connected with the main drain, any imperfection there is quickly noticeable throughout the house, and we are notified. As a rule, however, owners through their janitors take great care to correct troubles of this kind, at the earliest possible moment, it being to their interest to do so."

THE USE OF RADIATED HEAT.

Its scientific production and application is new, and interesting as the use promotes economy.

A demonstration of this has recently been made by James Henderson at McKeesport, Pa., where he erected a furnace for heating scrap iron by burning natural gas; in the construction of this furnace six 1-inch gas pipes are placed at one end, which deliver the gas into a large expansion chamber, the quantity being regulated by valves and a blast gauge. The gas expands greatly in the chamber and travels from the open end of this chamber to the air tuyeres, situated at the end of the gas passage, where a measured quantity of cold air is delivered to the gas, which has become highly heated in its passage to meet the air by the heat radiated by the burning of the preceding gas. The heat is probably 3,000° F. before it meets the air. The air is delivered diagonally forward across the gas flue, so that its focus is but 6 inches from the heating chamber. The gas passes through the air, and is so thoroughly mixed that the combustion is perfect by the time the flame, thus produced, enters the heating chamber, and there is no smoke anywhere; the chimney top presents the appearance of radiated heat observable out of doors on a hot day.

The bed or hearth in the heating chamber is 20 feet long, 4 feet 6 inches wide, and 5 feet from hearth to roof in the clear; the flame passes clearly above the iron on the hearth, and about one foot clear of the roof to the uptake. Iron charged simultaneously at each of the four doors of the furnace becomes as quickly heated at the uptake as where combustion takes place, or in five minutes 250 pounds at each door is at welding heat and ready to draw, so that five piles may be heated every five minutes, of 250 lb. each. By charging at each door consecutively, a pile may be drawn every minute, or 1,440, or 180 tons, in 24 hours. It is claimed for this furnace that if air be excluded from passing through the doors, except when drawing and charging the piles (which is not the case at McKeesport), nearly all of the waste of 10 per cent usual in heating iron may be saved. The economy of fuel is very great, as the production is from three-fourths of that now generally used for heating, with seven times greater output from the less quantity.

Wrought iron exposed on the hearth of this furnace in large lots begins to melt in ten minutes, becoming mushy or so soft that it cannot be balled except it is first cooled by throwing water upon it, indicating that the furnace will be economical for making open hearth steel—its cost not being over \$3,000 to make it, with a bed to convert 20 tons per cast. There are no regenerators, nor is heated air used, nor is there any additional expense incurred in heating the gas. This furnace dispels the illusion that regenerators are essential to making high temperatures for steel making, and shows that steel may be made for about one-eighth the cost for furnace now incurred.

A small fan blower is placed in the gas pipe, where there is a possibility of a short supply of gas, to exhaust the gas from the wells, and at the same time measure the quantity used. The fan may be placed on the same shaft and be driven by the same pulley that drives the blower that supplies the air to burn it, thus automatically regulating the working of the furnace.
