#### Business and Personal.

The charge for Insertion under this head is One Hollan a line for each insertion; about eight words to a line Advertisements must be received at publication office as early as Thursday morning to appear in next issue

For Sale-New and second hand iron-working machinery. Prompt delivery. W. P. Davis, Rochester, N.Y. Presses & Dies. Ferracute Mach. Co., Bridgeton, N. J. Barrel, Keg, and Hogshead Machinery. See adv. p. 30. For best hoisting engine. J. S. Mundy, Newark, N. J. Best driers for grain, sand, clay, fertilizers, wet feed. green coffee, etc. S. E. Worrell, Hannibal, Mo.

The Improved Hydraulic Jacks, Punches, and Tube Expanders. R. Dudgeon, 24 Columbia St., New York.

Best Ice and Refrigerating Machines made by David Boyle, Chicago, Ill. 155 machines in satisfactory use.

Power presses and dles. Also contractors for special machinery. T. R. & W. J. Baxendale, Rochester, N. Y. Screw machines, milling machines, and drill presses The Garvin Mach. Co., Laight and Canal Sts., New York.

"How to Keep Boilers Clean." Send your address for free % p. book. Jas. C. Hotchkiss, 120 Liberty St., N. Y PackerRatchet Drills are drop torged from Norway iron and bar steel. Billings & Spencer Co., Hartford, Conn

For Sale-Chain Wrench, patented July 9, 1889. No reasonable offer refused. Address J. D. M., 1738 Madison Ave., N. Y. City.

Split Pulleys at low prices, and of same strength and appearance as Whole Pulleys. Yocom & Son's Shafting Works. Drinker St., Philadelphia, Pa.

For Sale—Theadjustable swing patent illustrated on page 67, this issue. Further information may be had by addressing the inventor, W. K. Miller, Troy, Kansas.

For low prices on Iron Pipe, Valves, Gates, Fittings, Iron and Brass Castings, and Plumbers' Supplies, write A. & W. S. Carr Co., 138 and 140 Centre St., New York.

The best book for electricians and beginners in electricity is "Experimental Science," by Geo. M. Hopkins. By mail, \$4; Munn & Co., publishers, 361 Broadway, N. Y.

Newspaper Work and Advertising for 1891. Everything a Manufacturer ought to do in this department attended to by the Manufacturers' Advertising Bureau and Press Agency, Benj. R. Western, proprietor, Ill Liberty Street, New York, in a systematic, business-like manner. Our mutual benefit combination rates, in which all clients participate, are lower than any individual ad vertiser can possibly secure for himself. Estbd. 1879.

Send for new and complete catalogue of Scientific and other Books for sale by Munn & Co., 361 Broadway. New York. Free on application

HINTS TO CORRESPONDENTS.

Names and Address must accompany all letters, or no attention will be paid thereto. This is for our information and not for publication.

References to former articles or answers should give date of paper and page or number of question.

Inquiries not answered in reasonable time should be repeated; correspondents will bear in mind that some answers require not a little research, and, though we endeavor to reply to all either by letter or in this department, each must take his turn.

Special Written Information on matters of personal rather than general interest cannot be expected without remuneration.

Scientific American Supulements referred

expected without remaneration.

Scientific American Supplements referred to may be had at the office. Price 10 cents each.

Books referred to promptly supplied on receipt of price.

Minerals sent for examination should be distinctly marked or labeled.

(2773) F. C. C. asks: 1. Have any people been killed while riding on electric street cars, or while getting on and off the cars, simply by a "shock" from the motor current? A. No. 2. Is that current strong enough to kill persons should they receive the full force of it through their bodies? A. It is in some systems. 3. Is this system of street car service more dangerous to ride upon than the horse or "grip" systems? A. We think not.

(2774) F. A. B. asks: 1. Why does a telephone buzz when near an electric street car line or after the current is turned on the electric light wires at night? A. The "buzz" is due to an intermittent, variable, or alternating current produced in the telephone wire by induction from contiguous electric wires carry ing heavy currents. 2. Is there any remedy for this, any devices to overcome it, and where could these be obtained? A. The only remedy is to work the telephone on a metallic circuit, i. e., use a return wire instead of the ground. The currents induced in the two telephone lines by the light or power lines will be in the same direction in both lines, and will consequently neutralize each other in the telephone.

(2775) D. J. P., Weymouth, asks for the best solution (not paint) to use on wood for the purpose of rendering it fireproof. A. Tungstate of soda is of high value as a fireproof agent. Phosphate of soda is also efficacious. The great point 1s to secure good absorption by the wood. Such solutions are sometimes used for match solints to prevent them burning with a glowing end after extinction.

(2776) X. Y. Z. asks how to make whiting into a cake, so that by rubbing a cloth on it lightly it will take up enough to polish any substance with, and thereby prevent the waste and dust as when used in the form of powder. A. Use plaster of Paris or dental plaster: mix with water. Do not rub the cake directly on the metal to be polished, as this may wear it

(2777) H. N. M. asks: What is the difference between frictional electricity and dynamic electricity? I mean in quality, or is there any difference? A. None scientifically. Practically, what you call frictional electricity is of vastly higher tension or E. M. F. and of lower average intensity than the other. One is also considered high tension electricity in repose, the other low tension electricity in motion. But there is no real difference between them.

(2778) J. G. W. asks: How best to paste a large paper map on cloth, and have it smooth. A. Stretch the muslin on a flat table, tacking the edges if necessary, spread the paper face downward on another table, and rub it over with perfectly smooth flour paste. If necessary, the paste must be passed through a fine If properly made, this will not be required. Then lift the paper and place it paste side downward on the muslin. Lay another piece over it, and rub it down with the hand

(2779) B. B. asks: How can drawings or diagrams be cheaply and easily made for lantern use without the aid of photography? A. Take thin transparent sheet zylonite or celluloid and wash thoroughly with water. When dry rub with fine whiting, to remove all grease. Drawings or writing can now be placed on the zylonite as easily as on paper. Tracings can be readily made which are better than those on gelatine. Clamp the finished work between two glasses 3% by 4 inches, and bind the edge with paper

(2780) E. U. S. asks: Will you please inform me the best remedy you know of for catarrh or cold in the head. A. Where the case is an uncomplicated one and the galvano-cautery is not needed, the following prescription, used as a gargle, and for snuffing up the nose, will be found efficacious. Equal parts of salt, soda bicarbonate, and borax; mix thoroughly and use a salt spoon of the mixture to a cup of warm water. Never use the solution cold, and not more than three times daily.

(2781) L. A. C. asks: 1. Would the exact center of a perfectly revolving shaft remain stationary or revolve? A. All material parts of the shaft revolve. The axis -- a purely hypothetical thing-does not revolve. 2. Is there truth in the often-heard state ment that one part of a carriage wheel revolves faster than the other part? If so, explain. A. All parts of the carriage wheel revolve with the same angular velocity. The forward motion of the top of the wheel is twice that of the axle. 3. Please explain why it is necessary for the pendulum of a clock to be lengthened as the clock approaches the earth's poles, in order to make its vibrations similar to those of a like clock at the equator. A. The earth being flattened at the poles, allows the pendulum to come nearer the earth's center than it could at the equator; in consequence of this and the absence of centrifugal force at the pole, the earth has greater power over the pendulum, and accelerates its vibration, thus causing the clock to gain time. The remedy for this is to lengthen the pendulum. 4. Is it possible to speak into one telephone and hear your own words through another telephone at approximately the same time? If possible, under what conditions? I tried speaking into one telephone and holding my ear to another at the same time, but I could nothear anything. The instruments were not placed very far apart on the circuit. A. The direct effect of the voice upon the ear is so great as to drown out the sounds from the telephone.

(2782) E. M. H. asks: 1. Would two one quart cells of Bunsen battery develop enough power in the motor described in the Scientific American Sup-PLEMENT, No. 767, to run a small fan, say 15 inches diameter, in the summer time, and if so, about how many hours would it run before becoming exhausted? A. It would probably require four or six such cells to run the fan successfully. The battery would run its motor for 24 or 30 hours. 2. Would the above named cells develop sufficient power in the motor described in SCIENTIFIC AMERICAN SUPPLEMENT, No. 783, to do the same work, and would the battery run it as long as it would motor above named? Would like to have run all night. A. The motor described in Supplement, No. 783, would run a very small fan with two cells of Bunsen battery. 3. What size wire should be used for the winding of the field magnet of the motor described in No. 783 of the Scientific American Supplement ! A. No. 24.

(2783) A. G. asks: I recently saw in a printing office a new process of making newspaper cuts The material consisted of a dark steel plate coated with a white composition, through which the drawing was scratched with a sharp steel point, thus forming a matrix for the stereotyper. Can you give us a recipe for the white coating used? A. The composition is essentially flour paste and whiting. The surface of the plate should be slightly roughened with sandpaper and rubbed over with the white of an egg first. Other formulas are used, but are generally kept secret. Sometimes silicate of soda is used instead of paste. Also see SCIENTIFIC AMERICAN SUPPLEMENT, No. 720.

(2784) A. N. asks: What is the composition of the size used by the book binder to make his gold leaf adhere to the leather before applying his heated lettering type. A. The size used is albumen the white of an egg beaten, allowed to settle, and di luted with water. The portion heated by the type or stamp becomes insoluble. The portion of the size not unhiected to heat may be washed off with a moist clot or sponge.

(2785) W. H. asks which is the finer gold a ring of eighteen carat or a gold coin. A. 18 karat is 34 gold and 34 alloy. United States gold and silver coin is nine-tenths gold and one-tenth alloy. The gold coin is much finer than the ring in question.

(2786) W. S. C. writes: I have been nakingsome Leyden jars according to directions given in Hopkins' "Experimental Science," and have had trouble owing to the conductivity of the glass, caused, I presume, by the metallic oxides used in their manufacture; some of them conduct so freely as to discharge the electroscope. Could you advise me what kind of glass to use and where it could be procured? A. Use jars made of sodaglass. A jar can be tested by temporarily wranping it with tinfoil, and placing tinfoil scraps or metal filings within it. If it is found to leak rapidly after charging, it must be rejected.

(2787) P. M. writes: I have a barrel of vinegar, partly made of cider and partly of whisky, which has turned into an iron-like black color. Will you be kind enough to let me know if it can be clarified to look white again? A. If it does not clarify on standing, try filtering through boneblack. Or add a little so-

lution of pure gelatine. Experiment with a small por-

(2788) J. D. B. asks: Can you give me a receipt for treating oleine so as to make it suitable for paint oil? Have tried ammonia, borax, soda, alum with muriatic acid, which clarifies it nicely, but it will not dry; to be used for barn paint. A. Oleine will only dry with great slowness, if at all. Heating with litharge will bring it to the condition of lead soap, when it will dry more easily. This, however, will change its nature and appearance. We doubt if you will succeed.

(2789) J. D. asks: 1. What is the meaning of Fahrenheit? A. Degrees of the Fahrenheit thermometer; each one indicates 1-180 of the difference between the temperature of melting ice and that of condensing steam at atmospheric pressure. 2. Pounds by or to the square inch as used in the case of steam boilers. A. The pressure of the steam above that of the atmosphere, as exercised on each square inch of the boiler.

(2790) M. S. G. asks for recipes for making: 1. A tooth wash. A. Camphor 1/2 ounce, tincture of myrrh 2 ounces, tincture of Peru balsam 2 ounces. Rectified spirit 1 pint, oil of spearmint 10 drops. 2. A tooth soap. A. Precipitated chalk 1 pound, powdered orris 1/2 pound, powdered myrrh 2 ounces, powdered white soap 3 ounces, powdered saffron 1 ounce, oil of lavender 2 drachms. Or following: Air dried Castile soap in powder and cuttle fish bone, also in powder, of each 2 ounces, honey 4 or 5 ounces, aromatics and perfumes to suit. 3. A tooth powder. A. Precipitated chalk 11/2 pound, powdered white sugar 1/4 pound, powdered orris root 1/4 pound, powdered cuttle fish bone 2 ounces, carmine 1/2 ounce, oil of rose 1/2 drachm, oil of bergamot 1/2 drachm, tincture of musk 1/4 drachm. There are numerous formulas for tooth preparations. We can supply books giving many receipts. Also consult query 2477.

(2791) A. W. H. asks how the bronzing of plaster casts is done. I have a natural size plaster cast of Shakespeare's face and I want to bronze it. A. The following is given as a process used in France for this purpose. Linseed oil soap is made by saponifying the oil with caustic soda and precipitating the soap with salt. It is separated dissolved in rain water and a mixture in solution of 4 parts blue vitriol and 1 part copperas, is added as long as a precipitate forms. This is filtered out washed and dried and 834 ounces, are applied with 1 pound quick drying varnish, and 51/4 ounces white wax. This is applied to the surface previously heated, and is baked in if necessary. The high parts are touched up with a bronze powder. As a simpler process, shellac the bust and then gild it with bronze powder and varnish. The varnish is sold with the powder.

(2792) H. R. asks for the simplest method for preparing and moulding gutta percha and hard rubber. A. Use heat and pressure. 2. Is there anything similar that can be cast in moulds without using any great amount of pressure? A. Nothing satisfactory can be recommended. Possibly some of the manufacturers of paper pails, etc., would make up articles to suit you.

#### Replies to Enquiries.

The following replies relate to enquiries recently published in Scientific American, and to the numbers therein given:

(2655) I would say, if I were to anwer Mr. E. P. H. in regard to heating burnisher, that it will burnish best at about 250° or 260°. Myburnisher has a thermometer attached, and will do best work at above heat. -A. H. M.

M. E. C. says: The crusts in the tea kettle can be softened and easily rinsed out by boiling sweet fern branches and leaves in the tea kettle for awhile. Eat a few cloves for hay fever or cold in the head.

#### TO INVENTORS.

An experience of forty years, and the preparation of nore than one hundred thousand applications for pa tents at home and abroad, enable us to understand the iaws and practice on both continents, and to possess un-equaled facilities for procuring patents everywhere. A synopsis of the patent laws of the United States and all foreign countries may be had on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices, which are low, in accordance with the times and our extensive facilities for conducting the business. Address MUNN & Co.. office Scientific American, 361 Broadway, New York.

#### INDEX OF INVENTIONS

For which Letters Patent of the United States were Granted

January 20, 1891.

AND EACH BEARING THAT DATE.

[See note at end of list about copies of these patents.]

	Air, apparatus for numidifying, w. Tattersan	445,094
	Air heating furnace, J. Young	445.130
	Air heating furnace, J. Young	444.940
	Auger, M. H. Jones	411 956
	Axes, manufacture of, C. W. Hubbard	444 836
	Axle bearing, car, W. B. Smith	
	Baby walker, A. Burkholder (r)	11.140

A printed copy of the specification and drawing of any patent in the foregoing list, or any patent in print, issued since 1863, will be furnished from this office for 25 cents. In ordering please state the name and number of the patent desired, and remit to Munn & Co., 361 Broadway, New York.

Canadian Patents may now be obtained by the inventors for any of the inventions named in the foregoing list, provided they are simple, at a cost of \$40 each. If complicated the cost will be a little more. For full instructions address Munn & Co., 361 Broadway, New York. Other foreign patents may also be obtained.

#### Advertisements.

Inside Page, each insertion - - - 75 cents a line Back Page, each insertion - - - \$1.00 a line.

The above are charges per agate line—about eight words per line. This notice shows the width of the line, and is set in agate type. Engravings may head advertisements at the same rate per arare line, by measurement, as the letter press. Advertisements must be received at publication office as early as Thursday morning to amear in part issue.

#### USE ADAMANT WALL PLASTER

It is Hard, Dense, and Adhesive. Does not check or crack. It is impervious to wind, water, and disease germs. It dries in a few hours. It can be applied in any kind of weather. It is in general use. Licenses granted for the mixing, using, and selling.

Address ADAMANT MFG. CO. 309 E. Genesee St., Syrncuse, N. Y.

# Patent Foot Power Machinery Outfits.

power. can successfully compete with the large shops, by using our New LABOR SAVING Machinery, latest and most improved for practical shop use, also for Industrial Schools, Home Training, etc. Caralogue free. Seneca Falls Mfg. Co. 695 Water Street, Seneca Falls, N. Y.

STEREOTYPING; THE PLASTER AND Paper Processes.—Composition and preparation of the mould, the best alloys of metal and proper degree of heat, trimming and mending the plate, etc. A minute description of both processes, with numerous illustradescription of both processes, with numerous illustra-tions. A paper of great interest to every printer. By Thomas Bolas, F.C.S., F.L.C. SCIENTIPIC AMERICAN SUPPLEMENTS, 773 and 774. 10 cents each.

#### PARABOLON MAGIC LANTERN

Price \$45.00.

Particularly suitable for making Bromide Enlargements and projecting Lantern Transparencies. We make several other styles singly and in pairs, for use with Oil or Lime light. Our Oxy-Hy terchangeable on all our lanterns. Special facilities on the premises for the production of Apparatus seum of Natural History, has charge of our Stide Coloring. Slides to order from Amateur Negatives. Correspondence solicited. J. B. 301 F. C. O. ...

16 Beckman Street, New York City, U. S. A. Price \$45.00.

Single Bell Chime Whistle, and all instruments used in connection with Steam, Air and Water. Sole Agents for Clark's Linen Fire Hose, NEW YORK. CROSBY STEAM GAGE & VALVE CO. Boother, Mass.

LIST OF

## Books on Electricity.

Practice. Vol. I. The Induction of Electric Currents. 500 pages, fully illustrated and with copious index. By J. A. Fleming. 8vo. cloth. London, 1889...........\$3.00 This book treats both practically and theoretically the subject of Electric Current Induction and the Alternating Current Transformer.

nating current Transformer.

Arithmeetic of Electricity. By T. O'Conor Sloane,
A.M., E.M., Ph.D. This work gives Electric Calculations
in such a simple manner that it can be used by any one
having a knowledge of Arithmetic. It treats of calculations for wiring, resistance in general, arrangement of
batteries for different work, and is supplemented by the
most practical series of tables ever published. It is absolutely indispensable to the practical electrician, as
well as to the amateur. Fully illustrated. 1891...\$1.00

Phrases. By E. J. Houston. 640 pages, with an appendix of 15 pages, and illustrated by 396 engravings. The author gives a concise definition of the word, term, or phrase, and a brief statement of the principles of science involved in the definition, with illustrations where

tors. By Frank L. Pope. Twelfth edition. Revised and enlarged. With illustrations. N. Y., 1888..........\$1.50 Electric Light and Power. Economic Value of Electric Light and Power. By A. R. Foote. 1889. \$1.00 Electric Light and Power. by A. B. Fosto, and Formulæ.

Electrical Rules, Tables, Tests, and Formulæ.

39 Andrew Jamieson, C.E., F.R.S.E. Fully illustrated.

Practical Electrical Measurement. (56 illustrations). By J. Swinburne. London and N. Y., 1889. \$1.75
Practical Electric Bell Fitting. A Treatise on the Fitting-Up and Maintenance of Electric Bells, and all the necessary apparatus. By F. C. Allsop. With nearly 150 illustrations. 1889. Practical Electricity. A Laboratory and Lecture Course for First Year Students of Electrical Engineering based on the Practical Definitions of the Electrical Units. By W. E. Ayrton, F. R. S. Nearly 500 pages, and 180 illustrations. Third edition. 1888. \$2.50 

Maier, Ph.D. 30 chapters, 250 lillustrations, and 30 pages.

1889. \$4,00

Voltaic Accumulator. The Voltaic Accumulator, an elementary treatise, By Emile Reynier. Translated from the French by J. A. Body. 1889. \$3.00

Wrinkles in Electric Lichting. By Vincent Stephen. Illustrated. N. V., 1888. \$1.00
