A GUIDE BLOCK FOR TELEGRAPH WIRES, ETC.

Where wires are to be run or stretched from pole to

pole, as in putting up telegraph, electric light, and

other wires, the device shown in the illustration is de-

signed to greatly facilitate the work. The improvement

has been patented by Mr. Ulysses H. Alexander, of

No. 1008 Delaware Avenue, Wilmington, Del. It con-

sists of a block adapted to be conveniently connected

with the cross arms of a pole, as shown in Fig. 1, the

block consisting of two hinged sections, each having

opening when the sections are closed. In the lower

trunnions. The two sections of the block are pre-

many improvements have been introduced and the price has been lowered, the manufacturers claiming that this is now the cheapest pumping apparatus in the world which is both serviceable and reliable, its only competitor in the field of domestic pumping being the cumbrous and uncertain windmill. It is supplied with a kerosene-burning attachment if desired, which renders the engine practically automatic.

THE EUREKA TEMPERED COPPER CO.'S EXHIBIT.

The exhibit at the World's Columbian Exposition of the Eureka Tempered Copper Co., of North East, Pa., is located in the southwest gallery of the Electrical building. The display is a wonderfully complete one, and seems to embrace nearly everything that it would be thought possible to make of copper or brass. It is shown in an attractive Moorish mosque, of which our illustration represents an exterior and interior view.

This company enjoys a wide reputation for its cast ing of copper without blowholes and without alloys, and its process of hardening copper, for which it was awarded the John Scott medal by the city of Philadelphia, at the suggestion of the Franklin Institute, in 1891. The company exhibit all sizes and types of commutators for street car and electric lighting. Their exhibit also includes bearings, gears, pinions,

The Decomposition of Steam.

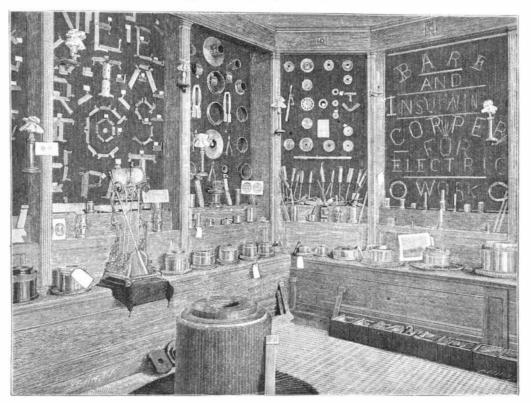

Herr Rosenfeld has devised a very pretty means of illustrating the decomposition of steam by a heated ALEXANDER'S GUIDE BLOCK FOR RUNNING WIRE. metal, which may make a really pleasing addition to the platform resources of a lecturer on water gas. For the purpose of the experiment, Herr Rosenfeldemploys a small quantity of powdered magnesium, introduced into a short length of combustion tube fitted at one end with a stopper and tube for the escape of gas, and connected at the other end with a vessel containing water.

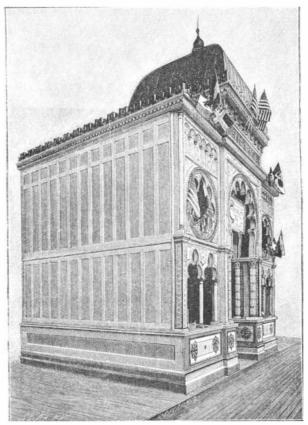

If this vessel is gently heated, while heat is also cautiously applied to the tube containing the magnesium. steam passes over and the metal merely glows-absorbing the oxygen and delivering a steady stream of hydrogen, which can be collected over water. If the evolution of steam is increased, so as to send a rapid current through the tube and over the heated metal, the latter burns with a dazzling light, and the heat soon breaks the tube. Before this can possibly happen, however, and necessarily end the experiment, a good the other green, noting the difference after they have deal of hydrogen will have passed over and been been cut open.—Southern Farmer. collected in the bell jar. The sequence of operations makes a highly effective lecture

tions being thus readily opened out for the introduction of the wire or its removal from the central open-

How to Test a Watermelon,

I draw my thumb nail over the melon, scraping off the thin green skin. If the edges of the skin on each side of the scar are left ragged or granulated, and the rind under the scar is smooth, firm, and white, and has something of a glassy appearance, the melon is ripe. But if the edges of the scar are smooth and even, and the thumb nail has dug into the rind in places, and the skin does not come off clean, then the melon is green. You can easily learn on two melons, one ripe,
