Business and Personal.

The charge for Insertion under this head is One Dollar a line for each insertion; about eight words to a line. Advertisements must be received at publication office as early as Thursday morning to appear in the following week's issue

Order pattern letters & figures from the largest varie Stow flexible shaft. Invented and manufactured by Stow Mfg. Co., Binghamton, N. Y. See adv., page 222.

"U. S." metal polish. Indianapolis. Samples free. For Sale-36" x24" Eng. lathe, \$450. S. M. York, Clev., O. Wm. Jessop & Sons have a handsome display of steel

in Mining building at the World's Fair. We have parties wishing to obtain interest in good patent. Address Crosby Bros., Dulutb. Minn.

The Improved Hydraulic Jacks, Punches, and Tube Expanders. R. Dudgeon, 24 Columbia St., New York.

Screw machines, milling machines, and drill presses The Garvin Mach. Co., Laight and Canal Sts., New York. Centrifugal Pumps for paper and pulp mills. Irrigating and sand pumping plants. Irvin Van Wie, Syracuse, N. Y. Emerson, Smith & Co., Ltd., Beaver Falls, Pa., will Hand Book on Circulars and Band Saws free to any address.

High Speed Engines-Single Cylinder and Compound, for all electrical and manufacturing uses. Watertown Steam Engine Co., Watertown, N. Y.

Split Pulleys at Low prices, and of same strength and appearance as Whole Pulleys. Yocom & Son's Shafting Works, Drinker St., Philadelphia, Pa.

The "Olin" Gas and Gasoline Engines, from 1 to 10 horse power, for all power purposes. The Olin Gas Engine Co., 222 Chicago Street, Buffalo, N. Y.

Perforated Metals of all kinds and for all purposes general or special. Address, stating requirements, The Harrington & King Perforating Co., Chicago.

The best book for electricians and beginners in electricity is "Experimental Science," by Geo. M. Hopkins. By mail. \$4; Munn & Co., publishers, 361 Broadway, N. Y.

Competent persons who desire agencies for a new popular book, of ready sale, with handsome profit, may apply to Munn & Co., Scientific American office. 361 Broadway, New York.

\$40,000 will buy stock, good-will, and fixtures of well established machine works at Philadelphia. These works enjoy a handsome trade and are well known throughout the United States, and to a young man possessing the requisites of purchase, together with mechanical abilities and business training, this will prove a rare opening. Address "Opportunity," care Scientific American, New York.

Send for new and complete catalogue of Scientific New York. Free on application.

HINTS TO CORRESPONDENTS.

Names and Address must accompany all letters or no attention will be paid thereto.
information and not for publication.
References to former articles or This is for our or answers should

References to former articles or answers should give date of paper and page or number of question.

Inquiries not answered in reasonable time should be repeated; correspondents will bear in mind that some answers require not a little research, and, though we endeavor to reply to all either by letter or in this department, each must take his turn.

Special Written Information on matters of personal rather than general interest cannot be expected without remuneration.

Scientific American Supplements referred to may be had at the office. Price 10 cents each.

Books referred to promptly supplied on receipt of

Minerals sent for examination should be distinctly marked or labeled.

(5404) Constant Reader writes: Will you kindly inform me through your valuable paper the component parts of concrete? I saw in your paper a long time ago (I did not need to use it then) an article respecting a buildi g, I think, in England, where they had used saccharine in some form, which had a hardening effect upon it, which is very important. If so, please state how much may be used in a given quantity. Please give all the information you can, as I want to build a large building with that material, if I can be persuaded it will be sufficiently strong. A. The proportions for concrete vary somewhat, depending upon the nature of 200 days, no longer can any current be gotten from it. the work and required strength. With the best American hydraulic cements. 1 part by measure to 2 parts sand, with an equal bulk of broken stone, makes a good strong concrete for pressure in the foundations of buildings and for walls. This may be varied to 1 part cement, 3 parts sand, 4 parts broken stone, for ordinary subwork. The use of sugar in mortar has been proved highly beneial to its strength and hardness, and also enables brick laying to be carried on in frosty weather, as such mortar does not freeze at several degrees below the freezing point. The proportion of 2 pounds of common brown sugar to 1 bushel of lime and 2 bushels of sand makes a mortar that sets as hard as cement and much quicker than ordinary mortar. As the sugar is supposed to be a solvent of lime, it should be added to mortar in a thin sirup, the previous mixed mortar being as thick as it is work it. The affinity of the sugar for the lime seems to partially dehydrate it and set free some water that thins the mortar. One pound of sugar to 16 gallons of water with the necessary lime makes a very hard and durable whitewash.

(5405) F. I. says: I noticed on an almanac that the sun's declination reaches 23° 27' in June and December. Is this correct? If not, please give it correct. At what angle is the moon's path inclined to baking powder. A. Mix two parts tartaric acid, three the earth's equator? What is the distance from earth to parts sodium bicarbonate, and three parts powdered moon at apogee and perigee? What is the distance from earth to sun at aphelion and perihelion? A. 23° 27' 6" is the dechnation for this year. The moon's orbit is inclined 5° 8" from the ecliptic, which gives the moon a variable inciination to the equator of 28° 35' to 18° 19' during the course of the regression of its nodes. Its mean distance is 238,840 miles. Its distance at apogee is 252.975 miles and at perigee 221,614 miles. The distance glass plate 18 inches in diameter and I wish to drill a 1/2

about 3,000,000 miles over and under the mean distance, which is assumed at 92,897,000 miles.

(5406) G. F. W., New Jersey, asks whether a person can get a stationary engineer's license that lives in New Jersey, and has a position in New Jersey, as I have had the offer of a position as engineer, but I will require a license to secure same. Also inform me what part of New York City I can obtain them. A. Engineer's licenses are given by authorities acting under local laws for use in the district in which they are to be used. You should apply to inspectors in your State, if there are laws requiring license. The license department for engineers for New York City does not issue licenses or certificates to any engineer until he has secured a position in the city. The license department is at police headquarters.

(5407) E. J. P. says: Around the circumference of a circle whose radius is 200 feet, and making four revolutions per minute, a bird is flying. In the center of the circle, and moving his gun with the bird. stands arifleman. If we suppose the bullet and bird to be each a mathematical point only, and the bullet to en counter no resistance from the atmosphere, where must be aim in order to hit the bird, no allowance being made for gravitation? A. The bird by computation will be flying 83'4 feet per second faster than the muzzle of the gun in the circuit, presuming the bullet to fly at the rate of 1,500 feet

per second; $\frac{83.4}{1500}$ then is 0.062 of a foot, or 34 of an inch,

that the bullet would strike behind the point aimed at.

(5408) R. R. J. asks: Please answer through your paper the following: How long can a storage battery stand in the acid without injury from sulphate, discharged? What is the remedy for a sulphated battery? Can it be fully restored? A. Sulphating, if bad, is cured by long overcharging with current about 30 p. c. below the maximum. Not the smallest speck of sulphatemust be allowed to remain on the plates. Too great a charging current will cause sulphated plates to buckle. To prevent sulphating give a good charge once a month. The time required for bad sulphating cannot be stated. It varies under different circumstances

(5409) S. G. S. writes: In your answer to J. W. S. (5318) I fully agree with you about putting the pump chamber in the water when it can be done. I fully understand what you mean by saying the only drawback in putting the cylinder 30 feet out of the water is that it is constantly liberating air from the water. A. All water in the natural state contains air in solution, which is entirely liberated under a vacuum: 30 feet above the water is very near the vacuum line. nd other Books for sale by Munn & Co., 361 Broadway, Under its action most of the air is disengaged by expansion and interferes with the economical action of the

> (5410) J. B. R. asks: What would be the difference in price between coal at \$2.64 per ton and petroleum at about 3 cents per gallon, for an equal number of horse power? Also the name and address of crude petroleum burners on the market. A. Coal at the 118

price named is of a cent per pound, and if of good 1000

quality is equal to 14,000 heat units per pound. Petro leum at price named is four-tenths of a cent per pound and equal to 20,000 heat units per pound. The propor tion figures that coal at the price stated is two and three eighthstimes cheaper than petroleum for fuel. W. J. Gordon, 235 Broad Street, Philadelphia; Meyers & Osborn, Cleveland, Ohio; Schutte & Goehring, Philadelphia; Aerated Fuel Co., Springfield, Mass., are manufacturers of petroleum burners for boilers. See SCIENTIFIC AMERICAN SUPPLEMENT, Nos. 623, 624, 673, for illustrated descriptions of petroleum burners

(5411) C. S. W. asks for a receipt for bleaching or removing the oil from calfskins. A. The removal of oil from oil-dressed leather is practiced as specialties by concerns in the Eastern States, by the naplitha process, by immersing the leather in naphtha in closed vessels for a suitable time, to extract the whole or a part of the oilas desired, when it is subjected to pressure for removing the naphtha and then dried. Bleach ing is further promoted by a bath of oxalic acid and acetate of lead dissolved in water. The details of these processes are kept as much as possible a trade secret We have no literature on this subject.

(5412) W. C. C. writes: When an ordinary charged storage battery is left untouched for about Is this due simply to the oxidation of the spongy lead plate, or does the peroxide on the other plate also undergo change? A. A spontaneous discharge is due to leakage. The material of the cell or surface moisture on the cell may act as a conductor and passes a slight current, which slowly exhausts the charge. Sulphating also takes place. A wet surface under the cells also tends to discharge them by acting as a conductor.

(5413) G. B. C. asks: What is the best thing to clean nickel plating, bicycles for instance, and to prevent their rusting? A. Polish the nickel plating with a paste made of vaseline and rouge and wipe the polished surface with a cloth moistened with vaseline.

(5414) C. H. McD. asks what to mix red lead with in order to make it stick to storage battery plate instead of using flannel. A. An excellent plan is to mix the red lead with 10 per cent sulphuric acid, to apply it as a paste to the roughened plate and holding it in position with parchment paper or other material to form the plate. After forming, remove the paper. There is no available cement for the purpose.

(5415) M. D. asks for proportions of bicarbonate of sodium, tartaric acid and flour to make starch, all parts by weight.

(5416) J. W. L. says: Can you inform me how pearl is colored to become smoked pearl? A. The smoked pearl is dyed after finishing, with aniline and other colors, and then polished.

(5417) R. B. S. says: I have a circular of the sun from the earth at aphelion and perihelion is inch hole through the center. A. The hole can be cut

with emery and water fed into a copper or brass tube revolved in a guide of wood or metal fastened to the glass with wax. The tube may be revolved between the hands or by a bow string; in the latter case a center should be fixed to the top of the tube by which to hold it in position when the bow string is turning it.

TO INVENTORS.

An experience of forty-four years, and the preparation of more than one hundred thousand applications for patents at home and abroad, enable us to understand the laws and practice on both continents, and to possess unequaled facilities for procuring patents everywhere. A synopsis of the patent laws of the United States and all foreign countries may be bad on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices which are low, in accordance with the times and our extensive facilities for conducting the business. Address MUNN & CO., office Scientific American, 361 Broadway, New York.
