

Scientific American.

ESTABLISHED 1845.

MUNN & CO., Editors and Proprietors.
PUBLISHED WEEKLY AT
No. 361 BROADWAY, NEW YORK.

O. D. MUNN.

A. E. BEACH.

TERMS FOR THE SCIENTIFIC AMERICAN.

One copy, one year, for the U. S., Canada or Mexico, \$3 00
One copy, six months, for the U. S., Canada or Mexico, 1 50
One copy, one year, to any foreign country belonging to Postal Union, 4 00
Remit by postal or express money order, or by bank draft or check.
MUNN & CO., 361 Broadway, corner of Franklin Street, New York.

The Scientific American Supplement

is a distinct paper from the SCIENTIFIC AMERICAN. THE SUPPLEMENT is issued weekly. Every number contains 16 octavo pages, uniform in size with SCIENTIFIC AMERICAN. Terms of subscription for SUPPLEMENT, \$5.00 a year, for the U. S., Canada or Mexico. \$6.00 a year to foreign countries belonging to the Postal Union. Single copies, 10 cents. Sold by all newsdealers throughout the country. See prospectus, last page.
Combined Rates.—The SCIENTIFIC AMERICAN and SUPPLEMENT will be sent for one year, to one address, in U. S., Canada or Mexico, on receipt of seven dollars. To foreign countries within Postal Union, eight dollars and fifty cents a year.

Building Edition.

THE ARCHITECTS AND BUILDERS EDITION OF THE SCIENTIFIC AMERICAN is a large and splendid illustrated periodical, issued monthly, containing floor plans, perspective views, and sheets of constructive details, pertaining to modern architecture. Each number is illustrated with beautiful plates, showing desirable dwellings, public buildings and architectural work in great variety. To builders and all who contemplate building this work is invaluable. Has the largest circulation of any architectural publication in the world.
Single copies 25 cents. By mail, to any part of the United States, Canada or Mexico, \$2.50 a year. To foreign Postal Union countries, \$3.00 a year. Combined rate for BUILDING EDITION with SCIENTIFIC AMERICAN, to one address, \$5.00 a year. To foreign Postal Union countries, \$6.50 a year. Combined rate for BUILDING EDITION, SCIENTIFIC AMERICAN and SUPPLEMENT, \$9.00 a year. To foreign Postal Union countries, \$11.00 a year.

Spanish Edition of the Scientific American.

LA AMERICA CIENTIFICA E INDUSTRIAL (Spanish trade edition of the SCIENTIFIC AMERICAN) is published monthly, uniform in size and typography with the SCIENTIFIC AMERICAN. Every number of *La America* is profusely illustrated. It is the finest scientific, industrial trade paper printed in the Spanish language. It circulates throughout Cuba, the West Indies, Mexico Central and South America. Spanish and Spanish possessions wherever the Spanish language is spoken. \$3.00 a year, post paid to any part of the world. Single copies 25 cents. See prospectus.

MUNN & CO., Publishers.

361 Broadway, New York.
The safest way to remit is by postal order, express money order, draft or bank check. Make all remittances payable to order of MUNN & CO.

Readers are specially requested to notify the publishers in case of any failure delay, or irregularity in receipt of papers.

NEW YORK, SATURDAY, JULY 21, 1894.

TABLE OF CONTENTS OF SCIENTIFIC AMERICAN SUPPLEMENT No. 968.

For the Week Ending July 21, 1894.

Price 10 cents. For sale by all newsdealers.

I. ARCHAEOLOGY.—The Ancient Monuments and Palatial Architecture of Mexico and Central America.—The great remains of the new world eloquently portrayed.—Recent results of study of the inscriptions.....	15476
II. ARCHITECTURE.—The Use of Cork as a Building Material.—By S. SAMPOLLO.—The possibilities of cork as a structural material for houses.....	15471
III. BIOLOGY.—Effect of Great Cold on Animals.—Notes on Pictet's recent researches.....	15475
IV. BOTANY.—Cruel Plants.—A plant which catches butterflies in its corolla.—2 illustrations.....	15475
A Hothouse on Rails.—1 illustration.....	15475
V. CIVIL ENGINEERING.—A Temporary Trestle.—By ROBERT A. CUMMINGS.—Notes on this type of railroad construction.—2 illustrations.....	15467
Concrete Bridge at the Antwerp Exhibition.—A Portland cement bridge recently erected. 2 illustrations.....	15466
The Strabo's Prism Telemeter.—An instrument for measuring distances.—6 illustrations.....	15470
VI. EDUCATION.—Our American Schools.—Their progress, condition and prospects.—By DUANE DOTY.—An admirable article on the educational system of the United States.....	15472
Our Great Debt to Science.—A plea for the higher education and for original research.....	15474
VII. ENGINEERING.—Engineering a Learned Profession.—By R. H. THURSTON.—A plea for the engineer and for his high professional status.....	15467
VIII. MECHANICAL ENGINEERING.—Early Steam Road Locomotives.—The achievements of the early day of engineering in the line of traction engines.....	15469
IX. METEOROLOGY.—The St. Alban Landslide, near Quebec.—A very remarkable catastrophe, due to the flooding from melted snow.—3 illustrations.....	15477
What is a Cloud Burst?—By CHARLES L. HAGEBOOM.—The disastrous occurrence described and explained.....	15478
X. MILITARY ENGINEERING.—American Military Roads and Bridges.—By Prof. P. S. MICHIE.—The history of the military works in civil engineering of the United States.—Permanent and temporary structures described.....	15464
XI. MILITARY TACTICS.—The Passage of Rivers by Cavalry.—A detail of cavalry tactics and maneuvering examined and discussed.....	15465
XII. MISCELLANEOUS.—A Boy Giant.—A young giant exhibiting in Europe.—1 illustration.....	15474
XIII. NAVAL ENGINEERING.—The Spanish Warship Infanta Maria Teresa.—Full details of a powerful accession to the Spanish navy.—1 illustration.....	15463
XIV. PHYSICS.—The Work of Hertz.—The identification of light waves with electro-magnetic waves.—A paper by OLIVER LODGE.—1 illustration.....	15473
XV. RAILROAD ENGINEERING.—Railway Carriage Cushion Cleaner.—Apparatus for cleaning and brushing railway seats.—1 illustration.....	15470
XVI. TECHNOLOGY.—Some Facts about Rubber.—A popular account of the gathering and curing of India rubber.....	15476

AN AMERICAN BULLET PROOF SHIELD.

Mr. W. J. F. Lennard, a stairbuilder, of Brooklyn, N. Y., has invented a bullet proof shield claimed to be superior to that of Herr Dowe, the Mannheim tailor, described in the last issue of the SCIENTIFIC AMERICAN. It is said to be composed of cotton, felt, wood, and a chemical compound of parts mineral and vegetable. A public test of the bullet proof qualities of the new shield was made at one of the Brooklyn parks on July 12. It was in the form of a pad seventeen inches long, thirteen inches wide, and a trifle less than two inches thick, being somewhat flexible, and weighing eleven pounds. This pad was hung on the neck of a wooden figure, and shot at by a marksman with a 45 caliber army rifle, the cartridges being loaded with seventy grains of powder and 405 grains of lead. The bullets partially penetrated and embedded themselves in the pad, but did not go through it. The inventor afterward put on a similar pad, and was shot at by the marksman, the same gun and cartridges being used, when the shield proved an effective protection against the bullet. The inventor said there was no feeling from the impact of the bullet, except a slight sensation as if some one had poked him with a finger. The inventor does not claim that this shield would be effective against steel bullets, but only against lead bullets. His shield is the result of experiments for a composition to use in armoring ships, which he claims will be lighter and better than steel plates.

FAILURE OF A LARGE ARMOR PLATE.

An armor test of a Carnegie nickel-steel Harveyized plate, seventeen inches thick, took place at the Indian Head proving grounds on the Potomac near Washington, July 12, and like the eighteen inch Bethlehem plate tested May 19, ended in the failure of the plate. The same gun—the 12 inch rifle—was used in both cases. The plate was secured to a 44 inch oak backing, heavily braced. The distance of the gun from the target represented a range of about 1,200 yards. The Carpenter projectile weighed 800 pounds and was propelled by 260 pounds of brown prismatic powder; the muzzle velocity was 1,410 feet per second. The first projectile fired penetrated 13½ inches and then bounded back 50 feet. In the second Wheeler-Sterling shot the velocity was increased to 1,858 feet per second and the striking energy was advanced to 20,370 foot tons. The havoc wrought was terrible; the shot crashed through the plate and backing, deflected up, and landed 300 feet away. The head of the shot was somewhat injured, but the body of it was intact. The result was a great surprise to all concerned, especially to the makers, who had used all possible care in its fabrication, the plate being left in the Harvey furnace for twenty-eight days. Upon this test depended the acceptance of 287 tons of armor for the battleship Oregon, worth \$246,000. The loss to the company for the plate, even if the armor is finally accepted, will be \$20,000.

The Secretary of the Navy ordered another test the next day, using the same shells as were used in the June test of a Bethlehem plate. The Carpenter projectile penetrated the plate and stuck fast in it; the plate was cracked. The Navy Department will conduct exhaustive tests on Harveyizing armor before accepting more plates.

EDUCATION IN AMERICA.

We publish in the SCIENTIFIC AMERICAN SUPPLEMENT of this week a very remarkable paper on the schools of America, by Duane Doty, Superintendent of Public Instruction of Chicago. It is a summary of the last report, just issued, of the United States Bureau of Education. From the earliest days of the republic, the necessity of education for the people has been a generally accepted doctrine, and the impost of taxes for the purpose has been generally acquiesced in willingly. It is hard to see how any substitute for the public schools could be invented. It would seem more logical for each individual to pay for the education of his own family. But private schools would never be so widely distributed as are the public schools. In the rural districts, far from any village of account, will be found the public school, to which children resort from miles away in all directions. Private enterprise would never do the work done by the rural public schools.

The statistics and data contained in the article referred to are of deep interest. They go to show what an immense machinery is used in public school education, and reveal an industry of the largest dimensions devoted entirely to intellectual culture and advancement. The same statistics show the rapid growth of the system. Every year sees it more developed and more difficult of replacement. The great area of our country is one of the causes which will tend to make it permanent.

The paper referred to, however, is devoted to education in general, not merely to the public school system. It shows that as the higher departments are reached, the percentage of scholars attending private schools increases. But the facts that in the elementary grade of public school ninety per cent of the school population are educated and that in all schools and colleges

together the public schools and colleges educate eighty-nine per cent are impressive. The agency which controls the education of so large a proportion of the population of the country is one which should receive the greatest consideration and care from those administering it, for education can be a power for evil as well as for good.

BROOKLYN MEETING OF THE A. A. A. S.

The scientific and educational institutions of Brooklyn have united in inviting the American Association for the Advancement of Science, with its affiliated societies, to hold its forty-third annual meeting in that city. The hotel headquarters of the officers and others will be at the St. George Hotel. The official time as announced will be from August 15 to August 24, although some of the special societies may meet earlier or later than those dates. The opening sessions will be held daily in the Polytechnic Institute, the evening addresses and receptions will be in the Academy of Music and Art Building, and the sections will meet in the rooms of the Packer Institute. Every facility for lantern illustration will be in constant readiness for the day meetings, as well as when required in the evening. Many eminent foreign scientists have accepted invitations to be present, which will add much to the interest of the occasion.

Excursions have been planned for combining science with social pleasure to various mines, quarries, mountains, cliffs, and marl beds; to Long Branch for the study of marine algae; to Cold Spring to inspect the State fish hatchery; to West Point to inspect the Palisades and Highlands and Military Academy; various local trips to points of interest about the harbor, navy yard, etc., and finally, at the close of the sessions, an excursion to the Forestry Congress at the White Mountains. These plans are liable to be modified, and additional ones may be arranged for, of which notice will be given in due time. As far as possible these excursions are to be free, or at greatly reduced rates. The regular railroad rates to and from the meeting will be reduced, and special terms are to be had for hotel accommodations. Concessions will also be made by the express, telegraph, and telephone companies. In a word, everything will be done to make the Brooklyn meeting delightful and successful.

Full information can be had on application to the local secretary, Prof. G. W. Plympton, or to Mr. E. T. Johnson, relating to hotels and lodgings. It will be sufficient to address simply in care of A. A. A. S., Brooklyn, N. Y. Communications as to scientific papers, membership, etc., should be made to Prof. F. W. Putnam, permanent secretary, Salem, Mass.

THE GREAT RAILROAD STRIKE.

It is an accepted doctrine in political economy that the loss of one person's property is the loss of all. When a building burns in a large city, in some form or other the entire community has to bear the loss. Property is never destroyed without all suffering in some way. In the science of government a very general opinion is expressed in the saying that the best governed people is the least governed. Like some other sayings this cuts both ways; there is no doubt that a community of individuals, so orderly and well-behaved as to require but little government, would live very happily, and from their very nature would, in being self-governed, be little governed and well governed. But unfortunately the law has to deal with all classes of men. America especially has been receiving the outpourings of Europe for many years, and there is a strong feeling that the class of immigrants of the last ten or twenty years does not compare favorably with those of the preceding epoch.

The law throughout is based on the doctrine of expediency. A country governed by strictly logical laws would be far from practicable, at least under present conditions. The object of government being the preservation of order and peace and the prevention of crime, the law should secure these ends by the simplest and most efficacious means possible. Thus in a large city, if a given procession of innocently disposed people would be the occasion of a riot, no complaint could be made if the police took the practical though illogical step of prohibiting the parade and preventing the riot.

The great strike which has occupied so much of the attention of the country during the last few weeks is apparently on the point of collapse and illustrates the above points. The Federal troops have gone into action and seem to have done good work at the expense of very few lives. A vast amount of property has been destroyed, striking workmen have lost an immense sum in wages, and Cook County, Illinois, together with other railroad centers where rioting has taken place, will probably be burdened with a very heavy tax bill for the payment of damages to property incidental to the rioting. Incalculable harm has been done and the entire United States will have to foot the bill. It is easy enough to criticize the use of the Federal troops in the matter, it is natural for local militia to object to fight their own neighbors and friends, it is well for the upholders of the strong arm of the law to exult in the
