invention or manufacture, this prize shall go to the most successful American competitor.

Third prize-\$1,000.

Fourth prize-\$500.

The third and fourth prizes are open to all competitors, foreign and American.

We present an illustration of the first prize winner. The Duryea carriage is made by the Duryea Motor Wagon Company, of Springfield, Mass. The Duryea wagon weighs about 700 pounds and is built for either two or four persons. The one shown in the engraving is arranged for two people. It is driven by two threehorse power motors, which use ordinary stove gasoline, so that the expense of running is less than onehalf cent a mile.

The wagons have a carrying capacity of eight gallons, so that they will run from 100 to 200 miles. The wagon needs recharging with water each day, and both the gasoline and water can be supplied to the wagon in five minutes. The object of the tank of water is, of course, to prevent the motor from overheating. Its runs backward or forward with equal facility, and has four speeds forward and one speed backward. It can be geared to different speeds to suit the roads of any locality, and may be run at any speed desired below its limit over roads over which ordinary traffic travels. The wheels of the carriage are 34 and 38 inches in diameter and are equipped with 2½ inch pneumatic tires, and it is easily governed, being steered and speeded by the same lever, being steered by a sidewise motion of the lever and speeded by a vertical motion. It is provided with a powerful brake, and as its motors are wholly independent, one will propel the carriage even if accident affects the other. As an electric spark explodes the charge, the danger of explosion is reduced to a minimum.

A Drop of Water,

The water which is now in the ocean and in the river has been many times in the sky. The history of a single drop taken out of a glass of water is really a romantic one. No traveler has ever accomplished such distances in his life. That particle may have reflected the palm trees of coral islands, and has caught the sun ray in the arch that spans a cloud clearing away from the valleys of Cumberland or California. It may have been carried by the Gulf Stream from the shores of Florida and Cuba, to be turned into a crystal of ice beside the precipices of Spitzbergen. It may have hovered over the streets of London, and have formed a part of murky fog, and have glistened on the young grass blade of April in Irish fields. It has been lifted up to heaven and sailed in great wool-pack clouds across the sky, forming part of a cloud mountain echoing with thunder. It has hung in a fleecy veil many miles above the earth at the close of long seasons of still weather. It has descended many times over in showers to refresh the earth, and has sparkled and bubbled in mossy fountains in every country in Europe. And it has returned to its native skies, having accomplished its purpose, to be stored once again with electricity to give it new life-producing qualities and equip it as heaven's messenger to earth once more. -Chas. S. Whiting, in the Museum.

Calcium Carbide.

At the annual meeting of the German Electro-Chemical Society, Dr. Borchers exhibited an apparatus by which he not only succeeded, nearly ten years ago. in preparing calcium carbide, but also showed that all the oxides which were regarded as irreducible could easily be reduced by the action of carbon. It consists of a small chamber or furnace of fire brick, through the walls of which pass thick carbon rods 40 mm. in diameter. Inside the chamber these are connected by a thinner carbon rod, 4 mm. in diameter and 40 mm. long. The furnace is fed with a mixture of lime and carbon. The action is not electrolytic; the effect of the current being simply to heat the lime to a temperature at which it is reduced by the carbon. An E.M.F. of 12 volts and a current of 90 amperes is used. The current may be either direct or alternating : and bv diminishing the length of the thinner rod calcium carbide can be produced with an E.M.F. of only 1 volt. so that electrolysis is out of the question. The reactions which take place are: (1) CaO + C = Ca + CO; (2) Ca+ $C_2 = CaC_2$. The above reactions are supposed to have been discovered by Moissan and Wilson, but the author refers to publications by Wöhler (1862) and himself (1891).-Zeits, f. Elektrotechnik. u. Elektrochem.; Jour. Soc. Chem. Ind.

A KEY RETAINING DEVICE.

For holding and securing keys in asylums, prisons, to be kept for the usual service, holding them in such way that they can only be removed by one having the proper release key, the improvement shown in the ac-Hensley, of Salem, Oregon. Fig. 1 is a face view of the device, which is represented in section in Figs. 2 and 3, Fig. 4 showing the key. The key-holding hook is pivoted to swing down, as shown in dotted lines, and at its upper end is a bevel and notch adapted to engage a bolt of the lock on the rear of the face plate, as

HENSLEY'S LOCKING BOARD FOR KEYS.

shown in Figs. 2 and 3, the bolt being spring-pressed and being disengaged from the hook by the release key.

THE LEBER PATENT PORTABLE FIRE ESCAPE. A simple and inexpensive portable fire escape, which may be packed in small compass to take but little room in a traveler's trunk or bag, is shown in the accompanying illustration. It has been patented by Victor Leber, and is manufactured by the Turner Machine Company, of Danbury, Conn. It consists of a clamp adapted to slide upon a rope, as shown in the small figure, the clamping or frictional pressure upon the rope being readily controlled by the person using the device. The two hinged parts of the clamp are provided with registering half grooves adapted for convenient use on different sizes of rope, and the clamp is held in gripping position upon the rope by a threaded locking lever on the outer end of which is a finger wheel. At the top and bottom of the clamp are rings through which the rope passes, affording a slight frictional brake, and at the bottom is also a double hook to which may be attached body and shoulder straps to support one

the whole device is designed to be so simple and safe in its mode of operation that there shall be no hotels and other places where many keys are required reasonable possibility of a person failing to make it work properly in an emergency. This apparatus may also be conveniently employed by painters, builders and electricians, and by all engaged in work companying illustration has been patented by Richard necessitating their being suspended outside buildings.

----Remedial Foods.

This list of food remedies compiled by the Housekeeper is well worth preservation for reference :

Celery is invaluable as a food for those suffering from any form of rheumatism; for diseases of the nerves and nervous dyspepsia.

Lettuce is useful for those suffering from insomnia. Water cress is a remedy for scurvy.

Peanuts for indigestion: they are especially recommended for corpulent diabetes. Peanuts are made into a wholesome and nutritious soup, are browned and used as coffee, are eaten as a relish, simply baked. or are prepared and served as salted almonds.

Salt to check bleeding of the lungs, and as a nervine and tonic for weak, thin-blooded invalids. Combined with hot water is useful for certain forms of dyspepsia, liver complaint, etc.

Onions are almost the best nervine known. No medicine is so useful in cases of nervous prostration, and there is nothing else that will so quickly relieve and tone up a worn-out system. Onions are useful in all cases of coughs, colds and influenza; in consumption, insomnia, hydrophobia, scurvy, gravel and kindred liver complaints. Eaten every other day, they soon have a clearing and whitening effect on the complexion.

Spinach is useful to those suffering with gravel.

Asparagus is used to induce perspiration.

Carrots for suffering from asthma.

Turnips for nervous disorders and for scurvy.

Raw beef proves of great benefit to persons suffering from consumption. It is chopped fine, seasoned with salt, and heated by placing it in a dish in hot water. It assimilates rapidly, and affords the best of nourishment.

Eggs contain a large amount of nutriment in a compact, quickly available form. Eggs, especially the yolks of eggs, are useful in jaundice. Beaten up raw with sugar are used to clear and strengthen the voice. With sugar and lemon juice, the beaten white of egg is used to relieve hoarseness.

Honey is wholesome, strengthening, cleansing, healing and nourishing.

Fresh ripe fruits are excellent for purifying the blood and toning up the system. As specific remedies, oranges are aperient. Sour oranges are highly recommended for rheumatism.

Watermelon for epilepsy and for yellow fever.

Cranberries for erysipelas are used externally as well as internally.

Lemons for feverish thirst in sickness, biliousness, low fevers, rheumatism, colds, coughs, liver complaint, etc.

Blackberries as a tonic. Useful in all forms of diarrhœa.

Tomatoes are a powerful aperient for the liver. a sovereign remedy for dyspepsia and for indigestion. Tomatoes are invaluable in all conditions of the system in which the use of calomel is indicated.

Figs are aperient and wholesome. They are said to be valuable as a food for those suffering from cancer. They are used externally as well as internally.

Bananas are useful as a food for those suffering from chronic diarrhea.

Pieplant is wholesome and aperient; is excellent for rheumatic sufferers and useful for purifying the blood.

Alumina from Clay,

An important contribution appears in Comptes Rendus, by Heibling, indicating the production of alumina from clay, so as to be absolutely free from silica and readily convertible into sulphate, etc. To this end the clay is thoroughly incorporated wi 'nа mixture, in equal parts, of ammonia and potassium sulphates, in such proportion that three molecules of ammonium sulphate may be present to every molecule of alumina, and the mixture is made into hollow bricks, which are then heated in an oven at 270 deg. to 280 deg. C. At this temperature both gaseous ammonia and acid ammonium sulphate are given off, which immediately reacts with the potash salt present, acid potassium sulphate being formed-the latter, at the above temperature, combining with the alumina of the clay to form alum. The alum is finally extracted from the bricks by means of water and freed from iron by recrystallization, and the insoluble silica remaining behind may be employed in cements. Granular alumina is prepared by spreading out the a vertical tower, which is traversed by the warm,

a new antiseptic discovered in Germany, but as it is intended to be used generally, it is also called antinounin. One part of the substance in from 1,500 to 2,000 parasites injurious to plants. Yeast used in brewing as strong as five per cent of the substance. It is odorless and very cheap.

THE LEBER PATENT PORTABLE FIRE ESCAPE.

making use of the device in escaping from a building. When the escape is permanently fixed in houses or factories, the rope is preferably attached to a hinged arm secured at the inside of the window cas-POTASSIUMORTHODINITROCRESOLATE is the name of | ing. The device may also be secured to the window casing. When several persons are in one room, the frictional pressure of the clamp may be controlled by one standing in the room to let down different indiparts of soapsuds is destructive to all the common viduals in turn, the looped end of the rope being then powdered alum in a thin layer on shelves arranged in secured to the straps by which the person is susremains fresh for a long time when treated with it; it pended, and the rope sliding through the clamp. As moist, ammoniacal fumes derived from the brick oven destroys all bacteria, and yeast can endure a solution one person reaches the ground, it is ready for another Thus the alum is transformed in situ into alumina. reto descend. Each apparatus is tested to 1,000 pounds taining the form of the original powder, and potassium before leaving the factory of the manufacturers, and and ammonium sulphates.
