RECENTLY PATENTED INVENTIONS. Mechanical.
Valve Gear.-Frank J. Chriest, Fort McPherson, Ga. This gear is designed to give the desired stroke and a very high speed to the valve, permits
of adjustment for lost motion, and permits more steam o pass into one end of the cylinder than into the other desired. A nut block is connected with the valv and adapted to receive an intermittent sliding motion
from the eccentric, permitting of the valve remaining from the eccentric, permitting of the valve remaining
open for a long tme at the end of the stroke, during the sack, before a aliding of the valve aqain rakes place The exhaust can be opened quickly, left open a long time, and still close at the proper moment.
Wrench.-Edward I. Morey, Durango, Col. This is a eimple form of wrench, of such construcion that when the wrench is in use the ratchet mechan-
ism will be relieved from undue strain. As the distanc between the jaws of the wrench is increased the handle is lengthened and the amount of leverage increased, the dliding section of the wrench
Wedge.-William I. Harmon, Mount Vernon, Washngton. This inventor has devised an improvement in wedges for felling and splitting timber, the wedge having a wooden body and a metal frame, the
head of the body projectingabove the frame and being urrounded by a metal band. The frame has opposite beveled sides incasing the body, and provision ls made or the expansion of the wooden body laterally in the rame.
Lifting Jack. - Harvey Holahan, Harvey, Il. This jack has a novel lever and pawl mechanism for raising and lowering the rack or ratchet lifting bar, and is adapted for general use or foremployment as a car jack. In a hollow standard is pivoted a lever to
which is pivoted a lifting pawl, a locking pawl beingpirwhich is pivoted a lifting pawl, a locking pawl beingpir-
oted to the standard and a ribbon epring connecting both pawls. A horizontally adjustable slide is attached to the pring, and by the aer different tensions as required to act on the pawls.
Coale Elevating Apparatus.George Haiss, New York City. This invention provides an adjustable support for an automatically filling coal shovel, the elevator portion being quickly projected over
a vessel or removed out of the way. The apparatua provides forthe complete control of the: shovel by the opetor in filling, transferring and emptying it
Hoop Flaring Machine.-Max H. Ritzwoller, Peoria, II. For evenly flaring and bending ron and steel hoops, this inventor has devised a machine which permits hoops of different gages to be flared uniPormly and freely, inexpensive hoop clamping attach terially altering the drive gear mechanism. The feed shafts have each a fixed head member formed with a circular socket in its clamp face, an opposing yielding
clamp head having a similar socket, and a washer held between the heads

## Agricultural

Rotary Harrow.-James G. Ferrill, Batesville, Ark. This is an impruvement in harrows ha ing two toothed rotary sections hinged to a transverse
coupling bar in such manner as to permit them to be coupling bar in such manner as to permit them to be
placed in horizontal or vertical position, for work or for moving the harrow to and from the fleld. It has an having a central spindle member apwardly projected, there being an inner annular member on the cross bars
and pendent tooth members loosely connected with the ner and outer annular member.
Planter.-Caleb E. P. Hobart, Cherosee, Iowa. This is an improvement apon a formerly patented invention of the same inventor, the plungers or ollowers in the seed pockets oeing so made as to relieve the fender or smoothing device from undue friction by a possible overcrowding of the pockets, provision being
also made for a more complete covering of the seed when dropped. A greater number of seed droppers 18 employed together with a shifting wheel forthe shaft operating the droppers, the wheel having marking shoes serving as check rowe, wh
when necessary.

## Miscellaneons.

Filtering Saccharine Juices.William Eassie and Otto Schmidt, Kealia, Kauai, Hawail.
Thisinvention provides a sand flltering apparatus consisting of a battery of tanks arranged in inclined series and provided with a feed pipe with inlets and valves for the several tanks, transfer plpes and valves connecting
the tanks, and inclined tronghs with rotary spiral conveyers being arranged to wash and convey the sand from one to the other. A carrier belt and an endless elevator
belt with buckets carry the washed sand to the higheat

Metallic Ceiling.-Valentine Moes ein, New York City. Thiscelling is so formed as to pe mit of conveniently fastening the panels in place on a netallic furring frame secured to joists without the use of wooden furring strips, at the same time forming a furring frame having longitudinal and transverse strips, each provided with a rail, and panels formed with flanges are adapted tofbe crimped on the rail.
Windmill Regulator. - Frank C. Rathbun, Ethan, South Dakots. Vanes are pivoted in
 cal planes and at different distances from the bore of the
casting, a connecting cod having its ends pivoted to the casting, a connecting rod having its ends pivoted to the
vanes, the improvement being applicable to all windmills which have a horizontal adis, and being adapted to hold the wheel steadily $n$ the wind, while it works automati.
cally to swing the wheel out of the wind in case the wind becomes too heavy.
Hinge.-Arthur H. Gilman, Aurelia,
niently applica ble to lids, covers and doors or piano cases and other ornamental articles. It ts very strong, and enedgewise arainat the part to which it ts hinged, learing a perfectly smooth outer surface. A pair of leaves have their adjacent ends equally curved in opposite directions, and piroted connecting levers arejeach pivoted at one pair of braces is connected at one end to one of the eaves and at the other end to one of the connecting levers.
Cutter for Welt Trimmers, Gustaf A. Hultin, Chicago. In. For simultaneously inseaming, this inventor has devised a simple and cheap cutter, comprising a head having parallel rows of peripheral knives, the rows being of dissimilar lengths. and the longer knives having their cutting edges inclined outwardly and downwardly from the edge nextto.the shorter
knives. The cutter is readily ground and made to trim knives. The cutter is readily
Typewriter Ribbon mechanism. Fred W. Overhiser, Cold Spring, N. Y. This inventor has devised means of automatically rev.rsing the move nent of the inking ribbon, and for a transverse move ment of the ribbon, which is antomatically operated in
connection with the reversing mechanism. While the machine is operating the ribbon has a constant move ment, and every portion of it is automatically brought in contact with the type, insuring uniform wear. An automatic reverse and transverse feed attachment is provided,
applicable to any machine in which the ribbon is fed rom spools on ehafts.
Firearms Pneumatic Firing De-ics.-Isaiah H. Simpson, Bnmswick, Me. The firearn , according to chis invention, connected at its breec ond with a cylinder on the stock, and in the forward end passage of the firing pin. The latter is on a plunger or piston sliding in the cylinder, the piston being propelled furward to Are the cartridge by forcing air into the rear end of the cylinder through a pipe extending to the outside of the stock, the operator being able to blow into the pipe with sufflcient force to propel the piston for-
wand and thus discharge the firearm.
Calendar. - George W. Shirk, Van Orin, IIl. This is a perpetual calendar for indicating the jear, month and day of the month for a number of years,
and automatically adjusts the day indicator when the and automatically adjusts the day indicator when the month-indicating dial is moved. It is designed to be and is of such shape and dimensions as to permit its face to be utllized to display business carde and other adver-

Line Reel. - Charles A. Koerner, Evansville, Ind. A reel convenient for holding chalk lines is formed of wire bent at the corners to produce end
flanges and to form eyes between the corners at the end portions of the body, a spindle extending through the eyes forming an axle, and there being a handle in align
ment with the axle. The device is very cheap and efl ment m
FUNNEL.-Edward N. Gaudron, Brook lyn, N. Y. For conveniently flling lamp founts, bottles,
etc., this inventor has devised an air-controlled cut-off ect., this inventor has devised an air-controled cut-off
valve mechanism comprising a valve and a piston, the valve controlling the inlet of the liquid from the fannel body to the nozzle, and the piston controlling the valve
to close it, the piston bemg operated by alr from a compreased air chamber.
Clothes Drier.-John Drum, Spo kane, Washingion. This is a device adapted for attachplaced on the drier. Bands clamped on the pipe sustain outwardly extending arms on which the clothes are hung, the arme being preferably formed of twisted wire and their outer ends being connected by bars ale
adapted to carry clothes. The arme of the drier may adapted to carry clothes. The arme of the drier may
folded down parallel with the pipe and out of the way.
Tea Chest.-Tylar B. Thonpson and Charles T. Hull, Missoula, Montana, and John H. Will one side at the bottom adapted to be closed by a tempo rary plate or cover, a shelf on the inside of the chest, and a drawer below the shelf, the drawer having a curved
front and sliding door. The improvement is designed to front and sliding door. The improvement is designed to
displace the ordinary wooden lead-lined chest, holding its contents so they will not deteriorate or be wasted, and the tea in lots.
Metal Frame and Stock. - Albert Wanner, Jr., Hoboken, N. J. This invention provides a member to which is secured a face member to form an inner and an outerflange, legs being secured to the back member at the outside, while the outer flange overhangs the legs and the inner flange forms a stop for the article ramed. The stock may be readily bent to the ebape de sired withont being distorted or having a tendency to
bend or flex irregularly.
Vehicle Seat Lock. - Thomas L. Pfleegor, Burlingame, Pa. This lock may be attached to any form of ahifting seat, automatically locking and preseat is in position. Opposite projectrog angle arms are attached to the forward and rear portions of the seat riser, and a face plate on the vehicle has openings to re ceive the arms, while a spring on the face plate has its
free end extending partially across one of the opcnings, and engages one of the arme when the seat is placed in position.
SPRING Horse Shoe.-Albert J. Walker, Jacksonville, Fla. This shoe permits the animal's hoof to freely expand and contract, so that the animal may fully develop his gait without danger of ends of the side portions of the shoe, the bridge piece being bent up rearwardly at an angle to the side portions and having its lower edge above them. The bridge piece made fiat to fit snugly on the surface of the hoof.
Water Closet Seat.-Patrick J. Ca- ing support from a wall or partition.
Notr.-Copies of any of the above patents will be uraiehed by Munn \& Co., for 25 cents each. Please send name of
of this paper.

NEW BOOKS AND PUBLICATIONS
Select Organizations in the United
States. William Van Rensselaer
Miller, editor. New York: The Knickerbocker Publishing Company. 1896. Pp. 347. Small 4to,
with views and portraits.

The present work is intended to supply a long felt A club in a metropolis is a necessity to the social and bueiness man as com riends. The wide scope of the present volume has made it possible to include such organizations as
Daughters of the Revolution, the American Library Asociation, the Loyal Legion, the American Whist League the Knights of Pythias, the National Academy of sciences and others. The work also embraces social musical, historical and patriotic, bicycle, kennel, and yacht clubs. The contributors include some of the best known club men in the United States, the portraits of many of whom are given in the present volume. The
half tone portraits, the printing and binding are of the half tone $p$ or
very best.
Biological Lectures Delivered a THE MARINE BIOLOGICAL LABORA TORY OF WOOD's HOLL IN THE SUM
MER SESSION OF 1894 Boston $\begin{array}{cc}\text { Ginn \& Company. } & \text { 1895. Pp. vis. } \\ \text { 287. } & \text { 8vo, illustrated. } \\ \text { Price } \\ \$ 2.65 .\end{array}$ The first volume of these lectures was offered in 189, and the reception which this and the succeeding volume every lecture of the present volume deals with th every lecture of the present volume deals with the such well known scientists as Professor A. E. Dolbear the late J. A. Ryder, C. O. Whitman and J. Loeb. J M. Macfarlane's lecture "The Organization of Botanical imely, but is unfortunately very short. Other lecture are "On the Limits of Divisibility of Living Matter," "A Dynamical Hypothesis of Inheritance
bryological Criterion of Homology,"etc.

or no attention will be paid thereto. This is for our
informtion and no Bererences to former articles or answers should

 price.
MIner.
marked orn thor labed.
(6582) F. E. W. asks: 1. With what velocity will water issue from a nozzle with a pressure of
125 lb . to equare inch 9 If the nozzle is 116 mch in diameter, how many cubic feet will be discharged in an hour \& A. The spouting velocity of water from a per-
fect nozzle, at 125 lb . pressure, is 8,100 feet per minute with a discharge of 10 cubic feet per hour from a $1-16$ inchnozzle. 2. What diameter should a jet or impact wheel (Pelton type) be to run at 2,800 revolutions per
minute, on a jet of this pressure \& A. A wheel should be minute, on a jet of this pressure ? A. A wheel should be
6 inches diameter for the speed and pressure stated. 6 inches diameter for the speed and pressure stated.
3. Have jou a Supplement describing "Edison's pyromagnetic motor "? A. Articles on Edison's apparatus
for the production of electrcelty alrect frum coal will be fuund in Scientific American, vol. lvii, No. 9, and SUPPLEMENT No. R26. A thermo-magneticgeneratorand (6583) C. A R bew
(6583) C. A. R. asks how to label bottles. A. The sand blast and other mechanical engraving
methods are altogether out of the question for any but nethods are altogether out of the question for any but
profeseional glass cutters. Nor can letters be cut very satisfactorily and legibly with a diamond. We have. then, nothing left but paper labels, and, as an adhesive preparation for such, experiment has shown the following formula to be about the best: Gum arabic, 1 oz . gum tragacanth (pulverized), 1 oz.; acetic acid, 40 min .; glycerine, 1 oz.; water, 2 oz. Dissolve the gums in the
water, hot: then add the acid and glycerine. The next water, hot: then add the acid and glycerine. The nex
difficulty as regards paper labels is the fugitive qualities of ordinary writing ink. A bottle labeled nitric acid. with a good bold black ink, may, in a few hours, bea with a good bold black ink, may, in a few hours, bear
nothing but a label with a few yellc w stains upon it to denote its coutents.
eswax. A. Pure wh. asks how to bleach dinary beeswax by exposure to the influence of the sun and weather. The wax is sliced into thin flakes and resting on posts to coarse cloth, stretched on frames, wax is turned over frequently, and occasionally sprinkled with soft water if there be not dew and rain sufficlent to moisten it. The wax should be bleached in about four weeks. If on breaking the flakes the was still appears yellow inside, it is necessary to melt it again, and flake and exposelt a second ime or even oftener, before it be comes thoroughly bleached, the time required being
mainly dependent upon the weather. There is a pre liminary process, by which, it is claimed, much time is saved in the subsequent bleaching; this consists in passing meltediwar and steam through long pipes so as to ex pose the wax as much as possible to the action of the steam: thenee into a pan heated by a steam bath, where it is stirred thoroughly with water and then allowed to settle. The whole operation is repeated a second and
third time, and the wax is then in condition to be more readily bleached.
(6585) C. F. asks for a formula for granOil or almonds, 16 pt.; sperma ceti (pure), 3 oz.; white wax (pure), 21/2 oz.; melt by a
gentle heat and add of otto of roses, 12 drops. Pour the liquid into a marbls or Wedgewood ware mortar containing about $13 / 9$ pt. of luke warm water, and agitate the whole briskly with the pestle until the oleaginous portion is well divided. Then throw the whole suddenly into a broad vessel containing 1 or 2 gal. of cold
water. Next, throw the "granulated cream" on water. Next, throw of mualin extended as a filter and shake and drain plece of minthe water out of it as possible. Lastly, put
as much of the
it into china or earthernware pota it is used as ordinary coid cream.
(6586) $\mathrm{H} . \mathrm{N} . \mathrm{M}$. asks for a formula for fireproof ink and paper. A. The pulp for the paper is composed of vegetable fiber, 1 part : asbestos, 2 parts;
borax, it part; alum, $\%$ part. The ink can be used in borax, it part; alum, o part. The ink can
either writing or painting, and is made according to the either writing or painting, and fasing recipe: Graphite finely ground, 22 drm. copal or other resinons gums, 12 grn .; sulphate of iron, 8 drm . tincture of nutgalis, 2 drm. ; sulphate of 8 drm. These
boiled in water.
