pupil his mistake. Therefore, the instrument indicates positively to the pupil whether the second key is depressed too fast or too slow with respect to the release of the first key, and enables the pupil to determine with accuracy whether the touch is properly cultivated.

ACCOUNT KEEPING BOOK.—THOMAS G. KNIGHT. New York City. This invention provides a new and improved account-keeping book designed for use as a collection account book and the like to enable the bookkeeper to see at a glauce the standing of a customer. It consists of an account-keeping book provided with a plurality of leaves ruled for forming an account of a given period and divided into a column for names of the customers and successive equal monthly divisions, subdivided for keeping account of the new business for the month, the total balance, and for remarks, each leaf heing provided with transverse perforations to permit a portion of it to be torn out and with apertures at each end and with fasteners for attaching the removed portion to another page.

TABLE AND DRAPERY-HOLDER. - ROBERT S GANOUNG. Seneca Falls, N. Y. This invention relates particularly to devices adapted for connection with a table for supporting a canopy of drapery over the same while the table is supporting a burial casket, and the object is to provide a device of this character which may be easily adjustable to height and also to so construct it that its several parts are detachable, so that the whole device, with the table legs, may be packed in the table top. In brief, the invention consists in a table adapted to support a burial casket, of a sleeve attached to the back rail of the table adapted to receive an adjustable rod, the rod being flattened on one side to engage a flattened portion of the sleeve. A standard is adjustable vertically with relation to the sleeve, and consists of telescopic sections and a bracket on the upper section of the standard. The apparatus may be adjusted to any height.

FIREPROOF PARTITION. - Francis Omeis, of Charleston, S. C., has secured a patent for a novel fireproof partition or wall, in which the studding or beam are formed of two metal plates curved and united to each other by rivets joining the central portion of the convex sides. When this beam is used as studding, it is secured at the top and bottom by angle plates. When a solid partition is built, wires extend through holes in the central part of the studding. Upon these wires are secured plaster-supporting webs of woven wire, or stamped sheet metal, and to this skeleton wall is applied plaster, which is built out until it covers the edges of the studding. When a thick, hollow wall is to be built. the wires are secured to the edges of the studding and a plaster support and plaster is applied in the same way as in the case of a lathed wall.

GRAIN-SEPARATING MACHINE,-C. E. CULVER Cashton, Wis. By means of this machine, oats and other light seed and dust are separated from wheat rapidly and thoroughly, and the different kinds of seeds and the dust are discharged separately. The grain is delivered to a revolving drum having small pockets in its interior. As the drum slowly revolves, the grain is packed into the pockets by flexible strips, and a rotary brush brushes back the oats and dust. The grain in the like The Basin, The Flume, The Pool, and Echo Lake pockets is carried upward by the cylinder, and the lighter materials, owing to the inclination of the cylinder, is made to discharge at the front while the grain is deposited on an inclined table down which it rolls. The small particles and seeds and the broken grain pass through perforations in the table and are delivered to one conveyer, while the grains of wheat are delivered to another conveyer.

DRY-KILN. - J. GUERRERO and J. UNGEMACH, Buenos Ayres, Argentina, have patented a dry-kiln, for quickly and thoroughly drying various substances. It is provided with inner and outer walls, and a furnace of novel construction for supplying the necessary heat. It has also an efficient system of ventilation by which the moisture expelled from the articles being dried is carried away. This drier can be nsed for many different purposes, but it is especially designed for the preparation of hung beef.

Designs.

CARTON FILLER. - ROBERT J. BARKLEY, Chanute. Kans. The design consists in a filler presenting the appearance of a series of panels equally spaced from each other. The panels extend transversely of two longitudinal members which are disposed in proximity to each other and extend across the central portions of the first-mentioned panels, whereby narrow elengated openings appear between the members extending lengthwise between the adjacent panels.

Note.-Copies of any of these patents will be furn ished by Munn & Co. for 10 cents each. Please send the name of the patentee, title of the invention, and date

NEW BOOKS, ETC.

A POCKET BOOK FOR MECHANICAL EN-GINEERS. By David Allan Dow. With over 1000 illustrations. London, Bombay and New York: Longmans, Green & Company. 1898. Pp. 740. Price \$2.50.

We learn from the preface that the preparation of the work has occupied the whole of the author's spare time during the past five years, and that he has also had the services of several assistants in the calculation of the tables and in the preparation of their illustrations, and we judge, from a cursory examination of the book, that the time has been well spent. It is a mine of valuable information presented in a terse form, easily understood by engineers. There are already a large number of en gineers' pocket books, but there always seems to be room for one more, as engineering practice moves so rapidly. We could not undertake to give an outline of the contents in the limited space at our disposal, but, in brief, it may be stated, it includes mathematics, calculations and civil and mechanical engineering, with special attention to steam, pneumatic, and hydraulic engineering. The book is beautifully printed and the type is astonishingly clear. Illustrations are freely scattered through

Business and Personal.

The charge for insertion under this head is One Dollar a line for each insertion; about eight words to a line. Advertisements must be received at publication office as early as Thursday morning to appear in the follow-

tricity is "Experimental Science," by Geo. M. Hopkins. By mail, \$4. Munn & Co., publishers, 361 Broadway, N. Y. Michigan Military Academy, Orchard Lake Michigan.

Twenty-first year. Prepares for leading Universities Graduates are now in Harvard, Yale, Princeton, Cor nell, and University of Michigan. New gymnasium. 50 x 100 feet. Address Colonel Rogers, Supt.

To Manufacturers.-Owning lands and buildings which are admirably adapted to manufacturing purposes situated in the great coal, iron, and timber belt of the Central South, I desire immediate correspondence with parties owning machinery, especially wood working machinery, who contemplate removing their business South. I am prepared to offer favorable opportunities to such. I also wish correspondence with those desiring to procure valuable iron land in the same section. Address Lock Box 204, Jonesboro, Tenn.

WHAT TO SEE IN THE MOUNTAINS ON THE LOW RATES.

That the mountain regions of northern New Hamp shire are famous is evidenced by the thousands of visitors who annually seek the section for a season of recreation and rest. It matters not to what portion of the mountain region you go, for you will never be dissatisfied, as the variety and extent of scenic attractions is unlimited and your expectations, no matter how ambitious, are more than fulfilled.

Several hundred square miles of mountain peaks comprise the White Mountam region, and of the scores of resorts located in its midst space permits mention of but a few of the largest.

Many consider the vicinity of Dixville Notch the most beautiful part of the White Hills. The view of the surrounding territory is very beautiful, for lakes, mountains, brooks, and ravines are everywhere around. making an interesting landscape. In the Franconia region one finds many odd though beautiful attractions. There the Old Man of the Mountain stands guard over a galaxy of wild though particularly impressive bits of nature work. There is Cannon Mountain and Eagle Cliffs and Mt. Lafayette and Agassiz and Cleveland, while a short way off is Cherry Mountain, The Twins, and the Presidential Range, while natural curiosities and Profile Lake are well worth visiting. Then, of course, all who go to the mountains want to visit the wonderland of New England, as that famous mountain pass, Crawford's Notch, is termed. Everything there is in its primeval state, and charming cascades, rushing forest stream and gigantic mountains make it the ideal place for the tourist, as well as the one seeking

There are very many other sections of the White Mountains equally attractive as pleasure resorts, and at any of them you will find excellent accommodations, for the mountain hotels are every one of them

Beginning September 10 and continuing until about the 8th of October, the Boston & Maine Railroad will place on sale at many of its leading stations reduced rate tickets to all points in the mountains. The choice of several routes will be allowed, and for information apply to any station ticket office. Send to the General Passenger Department, Boston & Maine Railroad, Boston, for the book "What to See in the White Moun-

personal rather than general interest cannot be expected without remuneration.

Scientific American Supplements referred to may be had at the office. Price 10 cents each.

Books referred to promptly supplied on receipt of Minerals sent for examination should be distinctly

(7494) C. S. D. asks (1) for a formula for coating the back of a photographic dry plate to avoid halation. A. Powdered purnt sienna is used, mixed with gum and water. See SCIENTIFIC AMERICAN SUPPLE-MENT, No. 1030. 2. Will this coating have to be removed before development? (I use Eikonogen developer.)

If so, how? A. Yes; with a tuft of cotton or sponge. (7495) S. M. R. says: Please answer through inquiry column the following: Formula for glue or paste which will adhere firmly, like the adhesive substance on envelops, at once it is applied. A. Postage stamp mucilage is said to be made as follows: Gum dextrine, 2 parts; water, 4 parts; acetic aoid, 1 part. Dis-

solve with the aid of heat and add one part of ninety per INDEX OF INVENTIONS ent alcohol.

(7496) J. B. asks: Could you tell me how to make the cement metal sign engravers use to fill in the letters with after they are cut? A. Melt together in a clean iron pot 2 parts each of best asphaltum and gutta percha; stir well together, and then add 1 part of gum shellac in fine powder. It may be used hot and mixed with smalt, vermilion or other pigment, if desired.

(7497) W. D. C. asks: Will water in small lakes, ponds, or large reservoirs evaporate when the humidity is at a high per cent as fast as at a low per cent, the thermometer and wind being equal in both instances? A. The term "humidity," as popularly used, means the relative humidity or degree of humidity, as compared with full saturation of the air with moisture, and not the absolute quantity of water vapor in a cubic foot of air. When the relative humidity is 100 per cent, the air contains all the water vapor it can hold.' It can take no more, and water in ponds, etc., or in clothes hung upon a line, where humidity is 100, cannot evaporate at all. Under a high humidity, evaporation is slow; under a low humidity, it is rapid, other conditions being equal. Every housewife knows that on some days water does not boil away out of her kettles, and on other days it disappears rapidly. On the former humidity is high, on the latter it is low and the air is dry.

(7498) C. B. asks: 1. Can same size wire be used to wind motor of SUPPLEMENT, No. 641, for a dynamo, and if the same circuit is used? A. There is no difference in the winding of a machine to use it as a dynamo or as a motor. 2. Will a soft iron solid ring do for the armature? I use cast iron fields. A. You will have about one-half as much power with cast iron as with wrought iron. The design is made for wrought iron.

(7499) F. G. asks whether the direct or alternating current should be used in the electric arc furnace illustrated and described in a late issue of the SUPPLEMENT. A. Either current may be used.

(7500) W. R. A. says: 1. Can you tell me what photographers use to obtain the high gloss which some photos have? It seems to be a thin coating of some kind that is put on over the picture that gives it the appearance of glass. A. Use very clean plates and rather larger than the prints to be enameled. Wipe them well, rub them with talc, and remove the excess with a soft brush passed lightly over the surface. In a dish, half filled with ordinary water, immerse the photographs and allow them to soak. This being done, coat one of talced plates with enameling collodion in the ordinary way, agitate to cause the ether to evaporate, and when the film has set—that is to say, in a few seconds-steep this plate, the collodionized surface up, in a second dish containing pure water. Now take one of the prints in the first dish and apply the printed side to the collodion, remove the plate from the dish, keeping the print in its place with the finger of the left hand, and remove the air bubbles by lightly rubbing the back of the photograph with the forefinger of the right hand. Care has been taken beforehand to prepare some very pure starch paste, passed through a cloth, and some thin cardboards, or simply thick paper, the size of the plates used. The air bubbles having completely disappeared. and the perfect adherence of the print ascertained, dry with bibulous paper, and spread over the prepared cardboard on paper a coating of the collodion by means of a flat brush. Apply this sheet on the print, pass the finger over it to obtain complete adherence, and give it twentyfour hours to dry. At the expiration of this time, cut with a penknife the cardboard or paper ven with the print, and detach by one corner. If the plate has been well cleaned, the print will come off itself. We get in this manner a very brilliant surface, and as soild as that obtained by use of gelatine, which, as it is seen, is entirely done away with in this process. The prints are afterward mounted on thick cardboard in the usual way. It is possible, by mixing with the collodion some methyl blue, dissolved in alcohol (a few drops are sufficient), to obtain moonlight effects, especially if a rather strong negative has been used. For sunsets, make use of an alcoholic solution in coccinine. Wet gelatine prints are simply rolled down on clean ferrotype plates which have been previously rubbed over with a cloth having a very minute quantity of beeswax rubbed over it, the beeswax being almost entirely removed from the ferrotype plates by means of a clean cloth. The prints will come off readily when dry. 2. Also is there such a thing as liquid celluloid, and is it proof against heat and cold-that is, will either of them cause it to crack? I have taken your paper for four years, and think it is the best in the world. A. There is a celluloid varnish called "Roxyline Enamel," sold by dealers in photographic materials, which is practically liquefied celluloid. Temperature will have little effect on it.

(7501) M I. M. asks for the composition for birdlime. A. Boil the middle bark of the holly, gathered in June or July, for six or eight hours in water. until it becomes tender; then drain off the water and place it in a pit under ground, in layers with fern, and surround it with stones. Leave it to ferment for two or three weeks, until it forms a sort of mucilage, which must be pounded in a mortar, into a mass, and well rubbed between the hands in running water until all the refuse is worked out; then place it in an earthen vessel and leave it for four or five days to ferment and purify itself. Remarks: Birdlime may also be made from mistletoe berries, the bark of the wayfaring tree, and other vegetables by a similar process. Should any of it stick to the hands, it may be removed by means of a little oil of lemon bottoms or turpentine. Use.-To rub over twigs to catch birds or small animals. It is said to be discutient when applied externally.

TO INVENTORS.

An experience of fifty years, and the preparation of more than one hundred thousand applications for patents at home and abroad enable us to understand the laws and practice on both continents, and to possess unequated facilities for procuring patents everywhere A synopsis of the patent laws of the United States and all foreign countries may be had on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices, which are low, in accordance with the times and our extensive facilities for conducting the business, Address MUNN & CO., office SCHNTIFIC AMERICAN, 301 Broadway, New York,
