

RECENTLY PATENTED INVENTIONS.

Agricultural Implements.

CULTIVATOR.—LOUISA W. GRAUERHOLZ, Kensington, Kans. The purpose of this invention is to provide a machine especially adapted for the cultivation of corn, which machine is so constructed that two rows of corn may be cultivated at one passage of the machine across the field. The invention enables any desired number of plows to be carried by each cultivator-beam, or permits the use of a single set of plows, if desired. The plows may, furthermore, be adjusted relatively to the ground and may be speedily returned to the soil, should they meet with an obstruction, the return taking place almost instantly after the obstruction has been passed.

Bicycle Appliances.

BICYCLE-ATTACHMENT.—JOSEPH W. SATTERTHWAITE, Mingo Junction, Ohio. The attachment forming the subject of this invention may be secured at the front of the bicycle, and comprises a frame capable of being removed and secured to the bicycle handle-bars and steering-head. The frame has a support upon which a child or any other load may be carried.

SOCIABLE BICYCLE.—WILLIAM F. WILLIAMS, London, England. This bicycle has a single central main frame on which a transverse laterally-adjustable frame, which supports seats for passengers or receptacles for goods, is mounted to slide. A rack-bar couples the saddle-supports so that these supports may be moved together. A self-locking pinion effects the lateral adjustment of the saddles and retains them in position. A supporter is provided to hold the bicycle in an upright position when the riders are mounting or dismounting. The weight of the riders and load may be adjusted so as to balance unequal weights.

Engineering Improvements.

ROTARY ENGINE.—WILLIAM MOHR, Kurtz, Ind. The rotary engine of this inventor comprises a continuous cylinder having a steam-chest and a separate exhaust-chamber. A rotating piston extends with its rim into an annular slot in the cylinder-wall, and is provided with oppositely-arranged ports, one of which is the inlet-port. A piston-head is carried by the piston and extends into the cylinder. In the cylinders abutments slide. A reversing valve on one face of the piston is arranged to uncover one of the piston-ports to the steam-chest, to allow the steam to pass through the uncovered port into the cylinder. The reversing valve, moreover, is formed at its inner face with a cavity for connecting the covered-up piston-port with an exhaust-ported formed in the piston and leading to the exhaust-chamber.

Railway Appliances.

SWITCH.—GEORGE A. and THOMAS F. PENROSE, Meredith, Ark. The switch of these inventors has switch-points operated by an ordinary switch-stand, but constructed without the usual frog, the switch having, instead, means for lifting the wheels of the car from one rail to another. With the main and switch rails are connected a swinging wheel-lifting rail, forming a continuation of one of the switch-rails and overhanging the adjacent main rail. Two guard-rails are mounted to swing on independent axes adjacent to the wheel-lifting rail, the connections converging and extending to a common point on the wheel-lifting rail, at which point the connections are pivoted to the wheel-lifting rail, whereby the movement is directly transmitted to the wheel-lifting rail. A train passing over the tracks will be caused to take the switch by the action of two switch-points, the one serving to slide the train laterally toward the switch and the other serving to lift the corresponding wheels up from one rail to the other.

Mechanical Devices.

MACHINE FOR CONSTRUCTING IRRIGATING OR OTHER FLUMES.—JOSEPH H. MARTIN and DAVID ORMAND, Riverside, Cal. In this machine are provided a mold for the flume, a hopper connected with the flume, a paddle mounted in the hopper and adapted to distribute the concrete delivered by the hopper in the mold, and a plunger mounted to slide in the body and in the mold-section, and operated by a lever to pack the concrete firmly together after it has been delivered by the hopper. The plunger's being resisted by the concrete already packed will cause the whole machine to be moved on.

MORTISING OR GANG-DRILLING MACHINE.—ABRAHAM VAN WAGNER, New York city. It has been the object of this inventor to provide a device so small in cost and yet so effective in operation, that small shops unprovided with the usual large, costly mortising machines, may be enabled to produce work far more quickly than has heretofore been done by hand. The device comprises a frame consisting of legs secured to a table. The edges of the top member have guides which receive bars carrying the operating mechanism. Upon the top member an adjustable knee adapted to support the work, is secured. In order that the drills may be raised, a lever is provided, pivoted upon a bracket and connected with two links. The drill sockets are made to turn all in one direction by means of a series of pinions rotated by a gear-wheel. The machine is operated by foot-power.

ENVELOP MOISTENING, SEALING, AND STAMP-AFFIXING MACHINE.—HARVEY P. JONES, Chicago, Ill. On the water-tank of this machine is arranged a guided moistener to dampen the envelop-flap. After having been moistened, the flap is sealed by a device consisting of two yielding mounted plates, located between side bars. Springs bear between the plates and the side bars; and a presser mounted to swing between the plates presses the flap against one of the yielding plates to seal the envelop. After the envelop has been sealed, a stamp is moistened by a special device and applied.

PRINTING AND FOLDING MACHINE.—JOHN A. PYRON, Chester, Ill. This machine consists essentially of a printing mechanism and a folding mechanism. The printing mechanism consists of a plunger by means of which the printing is accomplished. The type having been inked, the plunger is raised, and a piece of paper

placed in position. After having been imprinted, the paper is acted upon by a folding strip controlled by a spring-roller. Plates located in various positions act on the paper to assist the folding strip in folding the paper in any desired shape. Although the machine is designed to print and fold labels used on mail-pouches or sacks, it may also be used in printing and folding circulars and the like.

TRACTION-WHEEL.—JEREMIAH J. GILLINGER, Quitman, Mo. In this traction-wheel, the opposite hubs of the main wheel are connected with a shaft extending through and between the hubs and carrying a fly-wheel between the shaft and main wheel. The power may be derived from electricity, gasoline, or any other motive agent.

Miscellaneous Inventions.

DEVICE FOR REMOVING DRILLS FROM WELLS.—FRANK M. KISER, Parkersburg, West Va. This invention provides a device designed to assist in the recovery of drilling tools when they have become bound in wells by the caving of the walls. The device used for this purpose comprises a bowl attachable to the bottom of the well-casing. The bowl has an interior cone surface at its bottom acting in connection with a clutch-dog. This dog is forced between the tool and the wedge-surface so as to bind the two together in order to enable the tool to be raised.

PRAYING OR CONFESSORIAL STAND.—HERMAN F. NEHR, New York city. The stand of this inventor is so constructed that the praying hench may be adjusted expeditiously and conveniently to suit all requirements. The reading desk may be adjusted to or from the occupant of the stand. The body-portion of the stand, or that portion which supports the praying bench, may be raised or lowered. The front and rear supports for the stand are arranged so that they may always be maintained in a vertical position or parallel with one another. An attachment for the reading desk is provided whereby a screen may be elevated from the desk at the front for confessional purposes, and held in its elevated position. When the screen is not required, it may be stored in a suitable receptacle beneath the reading desk.

CALENDAR-TELLURIAN.—GRANT B. NICHOLS, Wapakoneta, Ohio. This calendar-tellurian comprises a backboard or table having a series of marked apertures representing the elliptical path of the earth around the sun. The apertures correspond in number with the days of the year. A ball or globe representing the earth is held on a pin standing for the earth's axis and is adapted to be set in one of the apertures. An electric lamp carried by an inclined support is secured to the board at the center of the earth's orbit and represents the sun. Pointers are mounted to turn upon the central portion of the support and point to the name of the month and the day of the month, the names and days corresponding with sections of the earth's orbit. The calendar is arranged to indicate the month, the day of the month, the exact position of the earth relative to the sun on each day of the year, and the position of the earth in the zodiac. By means of the lamp, day and night may be correctly represented on the ball standing for the earth.

CARBURETER.—ELIAH D. PARROTT, Golden Dale, Wash. A gasoline supply-tank is provided in this apparatus from which there leads a gasoline supply-pipe. An air supply-pipe is connected with the gasoline-pipe. A burner heats the pipes. Water is used to cool the gas. An air-pump forces the gas into the gasometer. Throughout the generating process, the gas is maintained of the same strength. The gasoline is uniformly consumed according to the number of lights in use. Frost cannot form on the inside of the generating apparatus, and freezing of the gas-mains between the lights and the carbureter is prevented.

JACK.—GEORGE A. and THOMAS F. PENROSE, Meredith, Ark. The purpose of this invention is to provide a jack designed for use on railroads to shift rails longitudinally in order to equalize the joints. The jack has two clamps, each with a key for fastening them to adjacent rails. A bar is pivoted on one of the clamps and is fitted to slide in the other. A lever is fulcrumed on the clamp in which the bar slides. A link is pivotally connected with the lever. A grip engages the bar in such a manner that, when standing at an angle thereto, it grips the bar, and, when moving at a right angle, the grip slides on the bar. A foot on the link holds the grip in a slidable position.

WAIST-BELT.—SAMUEL BIENZUCHT, New York city. A waist-belt has been patented by this inventor which, while consisting of a series of links, permits the use of a yielding and a rigid material for alternate links. A yielding binding is used for the links, which binding is provided with integral eyes adapted for flexible connection with eyes formed upon the rigid links. The belt, though partially made of metal, will adapt itself to the figure as perfectly as a belt made entirely of softer material.

OIL-CAN.—ARTHUR C. HERSBERGER, Poolesville, Md. The body of this can has a neck, the upper end of which is engaged by the bottom plate of the spout, a washer being used to prevent the leakage of oil. At opposite sides of a downwardly extended peripheral flange of the plate, eyes or links are attached, to which a fastening device, consisting of a loop, is secured. By manipulating the loop, the spout-plate may be drawn tightly against the neck or removed laterally to permit the can to be filled. The invention does away with the old operation of unscrewing the parts in order to fill the can and is, hence, of especial service when used in connection with farm-machinery.

CHURN.—LEROY DRAKE, Shelton, Neb. This invention is an improvement in those churns which are made to rotate or oscillate, whereby the cream is alternately thrown from one end to the other and is caused to pass through a fixed, reticulated diaphragm for the purpose of quickly breaking the oily globules and inducing the formation of butter. The inventor of the present churn has devised an improved attachment for such churns, which attachment is in the nature of a collapsible diaphragm comprising two reticulated semi-circular parts flexibly connected. The diaphragm is firmly yet detachably held by means of a locking bar.

NUT-LOCK.—SILAS CHAMBERS, Sterling City, Tex. In the nut-lock forming the subject of this patent, a

simple washer or locking-plate is provided, which consists of a tongue formed with inner and outer wings, both of which are provided with openings for the operating tool whereby the tool may bear in both openings at the same time. The invention's especial merits are the ease of application and operation of the locking devices.

AMALGAMATOR.—MINNIE H. MACCLAY, Louisville, Ky. With a fixed frame, an ore-feed block having a vertical passage, and a float-gold arrester arranged in the passage and comprising a metal frame, are connected an oscillating mercury-box arranged beneath and partly inclosing this block and adapted to co-operate with the block, to scour and grind the ore. Hangers are provided for the box, and have knife-edge supports.

BOTTLE-CAP.—LOUISA G. FLANIGAN, Baltimore, Md. This invention furnishes a cap formed with a circumferential inturred flange around its upper and outer edge, which is adapted to receive the end of a tool to pry off the cap and which also makes a strong reinforced edge or crown for the bottle-mouth. With the cap is connected a disk or plate secured beneath the inturred flange and having a projecting thumb-piece or lug by which the use of a separate tool on removing the cap is not required.

PICKER-STICK ATTACHMENT.—FRANCIS M. HUTCHINSON, Mayfield, Ky. The picker-stick attachment for looms provided by this inventor has a pivoted casing adapted to receive a picker-stick. A loop is formed on the casing for the passage of a return strap. A hook formed on the casing above the loop receives the outer end of the return-strap. The picker-stick can be readily inserted in the casing and fastened therein after the desired adjustment is made.

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for 10 cents each. Please send the name of the patentee, title of the invention, and date of this paper.

NEW BOOKS, ETC.

MANUAL OF THE CANVAS CANOE. Its Construction. By F. R. Webb, "The Commodore." New York: Forest and Stream Publishing Company. 1898. Pp. 115. Price \$1.25.

We are always glad to review a book which gives practical directions for making things, and the present volume gives explicit directions for making an excellent canoe at an expense of \$12 to \$15. Full specifications and elaborate working drawings, numbering seventy in all, are given. The canoe proper is not only described, but the subject of repairs, camp equipment, conveniences, camp cooking, etc., are also treated. This excellent little book will be hailed with delight by all amateur boat builders.

HITTING VERSUS MISSING WITH THE SHOTGUN. By S. T. Hammond. New York: Forest and Stream Publishing Company. 1898. Pp. 170. Price \$1.

This book might be termed "The Hammond System of Shooting," for Mr. Hammond enjoys among his field companions the repute of being an unusually good shot and one who is particularly successful in that most difficult branch of npland shooting, the pursuit of ruffed grouse or partridge. This prompted the suggestion that he should write for others an exposition of the methods by which his skill was acquired. The result is the original manual before us. We term it original because the chapters will show the author was self-taught; the expedients and devices adopted and the forms of practice followed were his own. The volume will be warmly welcomed by sportsmen.

COMMERCIAL RELATIONS OF THE UNITED STATES WITH FOREIGN COUNTRIES DURING THE YEARS 1896 and 1897. In two volumes. Volume I. Issued from the Bureau of Foreign Commerce, Department of State. Washington: Government Printing Office. 1898.

Commercial relations of the United States with foreign countries is a very important subject at the present time, in view of the fact of our present export trade, which is constantly increasing. The volume is filled with important information and tables. The statistics are carefully classified and are thoroughly reliable.

THE STATISTICAL YEAR BOOK OF CANADA FOR 1897. Thirteenth Year of Issue. Issued by the Department of Agriculture. Ottawa: Government Printing Bureau. 1898. Pp. 554.

The annual volume issued by the Department of Agriculture, termed the "Statistical Year Book of Canada," contains a short history of Canada, and then treats of its constitution and government, land regulations, events of the past year, agriculture, minerals, trade and commerce, currency and banking, railways and canals, post office, finance, insurance, education, Indians, patents, vital statistics, criminal statistics, and the organization of the present government. It is a valuable manual for all who are interested in any way in Canada.

We have just received the Fiftieth Anniversary number of our excellent contemporary, "The Independent." Having had a Fiftieth Anniversary ourselves three years ago, we know how pleasant it is to celebrate the half century of a successful newspaper. "The Independent" is always a welcome visitor to office or home. It is a clean and fearless journal and gives to the reader nothing but matter of the highest class. It is published in convenient magazine form, and the price for a single copy is 5 cents, and the subscription price is \$2. The present anniversary number contains valuable articles by R. S. Storrs, Francis J. Higginson, Richard H. Stoddard, William Hayes Ward, Thomas Wentworth Higginson, Theodore L. Cuyler, Elizabeth Stuart Phelps, Edward Everett Hale, Cesare Lombroso, John La Farge, Justin McCarthy, Maurice Thompson and others. It would hardly be possible to obtain a more representative collection of writers. We heartily congratulate our contemporary on its Fiftieth Anniversary.

Business and Personal.

The charge for insertion under this head is One Dollar a line for each insertion; about eight words to a line. Advertisements must be received at publication office as early as Thursday morning to appear in the following week's issue.

About Elgin Watches.

Thirty-four years ago, it required no common courage for a body of men to invest their capital and devote all their energies to the founding of a watch factory in the then unknown village of Elgin, Ill., with any hope that its product should become more than locally popular.

The Elgin National Watch Company, established at that time and under these conditions, has long since demonstrated the wisdom and foresight of its founders.

Its reputation for making watches of the highest quality at consistent prices has gone round the world, and for many years its output has been sold in advance of manufacture.

Modern methods, inventive genius, making at their factories the machines with which watches are made, employing skilled experts—these are some of the facts that have made possible an output of nearly 8,000,000 complete and perfect timepieces from this great factory in the space of a third of a century.

A factory properly ventilated and lighted, congenial surroundings in home and factory life at Elgin have all concurred to the success that has ever marked the Elgin National Watch Company.

The Chicago Times-Herald, in its issue of September 5, 1898, speaking of the employees at the Elgin factory, mentions "the high character and intelligence of the operatives and their confidence in their employers, based upon long years of fair treatment," and adds, "It is perhaps not too much to say that the employees of the watch factory, both skilled and unskilled laborers, are the equal in every respect of any factory operatives in the country. Certain it is that they are far superior to ordinary factory workmen. One can tell their quality in a moment if he but takes the trouble to watch the stream of men and women moving toward the main gateway at the hour of commencing labor. The close and friendly relations which for so many years have existed between employers and employed have made the factory able to point with pride to a record of thirty-four years without either strike or serious industrial complication of any nature."

Notes & Queries

HINTS TO CORRESPONDENTS.

Names and Address must accompany all letters or no attention will be paid thereto. This is for our information and not for publication.

References to former articles or answers should give date of paper and page or number of question. **Inquiries** not answered in reasonable time should be repeated; correspondents will bear in mind that some answers require not a little research, and though we endeavor to reply to all either by letter or in this department, each must take his turn.

Buyers wishing to purchase any article not advertised in our columns will be furnished with addresses of houses manufacturing or carrying the same.

Special Written Information on matters of personal rather than general interest cannot be expected without remuneration.

Scientific American Supplements referred to may be had at the office. Price 10 cents each. **Books** referred to promptly supplied on receipt of price.

Minerals sent for examination should be distinctly marked or labeled.

(7529) F. E. J. asks: 1. Can an electric arc be produced in a vacuum? A. We reply in general, an electric arc cannot be produced in a vacuum, if by it you mean an arc light such as is used for lighting; but in the low vacuum of a Geissler tube an arc of purple light may be produced several feet long. In the vacuum of a Crookes or X ray tube no electric discharge can take place, and a tube may be so perfectly exhausted that no discharge will pass between terminals only $\frac{1}{4}$ inch apart. 2. Will it burn as bright as though produced in air? A. No. When the vacuum, is low enough for an arc to form, the light of it is of a purplish tint and is visible only in the dark. 3. Would ordinary glass answer for a globe for an electric arc in vacuum? A. Ordinary glass is used for the bulbs of Geissler tubes; but glass without lead for X ray tubes. 4. Would it require more power to produce an arc in a vacuum than in the open air? A. Certainly; more power is required to drive the electric discharge across a given gap as the air is removed from it, until the point is reached when the discharge ceases to pass the gap at all. Moore's system of lighting employs the discharge through vacuum tubes. It is not extensively in use as yet.

(7530) H. B. C. asks: 1. What kind of varnish can I use to coat a wading suit with? It must be perfectly watertight and flexible. A. Dissolve 1 ounce

of beeswax in 1 pint of the best boiled linseed oil over a gentle fire, applying when cold with a piece of rag, rubbing it well in and afterward hanging up to dry, which will take four or five days; or paint with boiled linseed oil colored to suit. It must be done in very hot room or in a bright sunlight. A shoebrush is the best for applying it. A little patent drier may be added. It is said that the Chinese use a mixture of 1 ounce each of beeswax and soft soap with the oil, which is then boiled down. If the surface seems tacky, varnish with shellac varnish. In any case, apply the oil as thin as possible and let it dry perfectly between successive coats. 2. Which side of a leather belt should be run next to the pulley? A. All the best beltmakers say run grain side to the pulley, and it is claimed that 33 per cent more power can thus be transmitted than with the flesh side next to the pulley. The grain of the leather has a velvety surface, which enables it to hug the pulley closer than will the hard flesh side. Some users run the flesh side to the pulley for small belts, and then daub and stick up the belt with beeswax or resin to make it take hold, but this is not economical for the life of a belt, is unworkmanlike, and there is always more or less fussiness in running machinery where the belts are so treated, instead of their running for years without any attention, as they will sometimes do when run grain side to the pulley, and of proper size to transmit the desired power.

(7531) D. L. G. asks how to adapt an arc lamp suited for 52 volts and 1 1/2 amperes to a circuit carrying 60 amperes at 104 volts. A. The arc lamp in question, when run on the 52 volt circuit, used probably 15 amperes and 45 to 50 volts, though perhaps it was wound so that it was put on the circuit directly at 52 volts. Such a lamp can be put on a circuit of 104 volts by supplying it with a rheostat whose resistance can be varied. It will require the same voltage and amperes as before. The other 59 to 54 volts will be taken up by the rheostat. This rheostat requires 200 feet of No. 12 (B. & S.) German silver wire. It should be arranged so that the coils can be cut out one by one to the last one, and then the current can be adjusted to the lamp. We advise you to call upon dealers in lamps of this kind.

(7532) J. J. W. asks: Could you advise the adoption of the storage battery instead of the trolley system for running a line of street cars from town out into the country? A. We regret to say that the storage battery has disappointed its friends in this respect. Even in cities it is not used, since it cannot compete in cost with the trolley. The trolley system is much cheaper, and on country roads there has never been any chance for the storage battery. There the overhead trolley is the best possible mode of electrical traction. In cities the open conduit underground trolley is at present considered the best. On leaving the town this is changed to the overhead trolley, as in Washington, D. C.

(7533) W. W. asks: For an electric heater on 110 volt circuit, what size and quantity of German silver wire is suitable? A. If you wish to make a small heater to use about 1 ampere of current with German silver wire, get 1,300 feet of No. 18 B. & S. gage. For a heater using about as much current as an arc light, get No. 12 B. & S. wire and about 500 feet of it. For articles on electric heaters see SCIENTIFIC AMERICAN SUPPLEMENT, Nos. 513, 825, 1112, 1185, ten cents each.

TO INVENTORS.

An experience of fifty years, and the preparation of many thousands of applications for patents at home and abroad, enable us to understand the laws and practice on both continents, and to possess unequalled facilities for procuring patents everywhere. A synopsis of the patent laws of the United States and all foreign countries may be had on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices, which are low, in accordance with the times and our extensive facilities for conducting the business. Address MUNN & CO., office SCIENTIFIC AMERICAN, 361 Broadway, New York.

INDEX OF INVENTIONS

For which Letters Patent of the United States were Granted DECEMBER 6, 1898,

AND EACH BEARING THAT DATE. (See note at end of list about copies of these patents.)

- Advertising device, J. W. Lynch..... 615,358
Air and gas mixer, J. F. Barker..... 615,320
Air brake, railway train, J. F. Voorhees..... 615,326
Air ship, F. R. Merritt..... 615,329
Airtight vessel, J. F. Davenport..... 615,478
Alarm. See Burglar alarm.
Alcohol, manufacture of, H. W. Wiley..... 615,376
Ambulance and tourist wagon, combined, C. H. W. Larnabee..... 615,296
Anticorrosion device, W. Wewers..... 615,580
Asphalt, etc., apparatus for manufacturing objects from compressible material, such as, A. Pieper..... 615,373

ELECTRO MOTOR, SIMPLE, HOW TO make.—By G. M. Hopkins. Description of a small electric motor devised and constructed with a view to assisting amateurs to make a motor which might be driven with advantage by a current derived from a battery, and which would have sufficient power to operate a foot lathe or any machine requiring not over one man power. With 11 figures. Contained in SCIENTIFIC AMERICAN SUPPLEMENT, No. 644. Price 10 cents. To be had at this office and from all newsdealers.

DORMAN'S VULCANIZERS
are used all over the world.
Exclusive Manufacturers of Steam Machines for Rubber Stamps. We also make Dry Heat Vulcanizers. Complete outfits from \$10 to \$1,000. All Stamp and Stencil Tools and Supplies. Brass and Steel Dies for all purposes. Seals, Engraving and Die Sinking of all kinds. Established 1860. Printing Presses, with complete outfits, from \$1 to \$100. Send for Catalogues.
THE J. F. W. DORMAN CO.
121 E. Fayette St., Baltimore, Md., U. S. A.

TRANSITS AND LEVELING INSTRUMENTS.
NICKEL PLATED ELECTRIC LEVELS
C. F. RICHARDSON ATHOL, MASS.
Sizes, 2 and 3 inches. Prices, 25 and 30 cents.
For Book on the Level. C. F. RICHARDSON & SON, P. O. Box 977, Athol, Mass., U. S. A.

Every Tool for Every Use
A complete list of all the Tools made for any and every purpose, all fully described and accurately illustrated will be found in the 1898 edition of MONTGOMERY & CO.'S TOOL CATALOGUE. It contains 510 closely printed pages with index. Book is pocket size, 6 1/2 x 4 1/2 inches, with rounded edges and stitched covers. Sent free by mail on receipt of 25 cents by

Horse power, A. J. Boyce..... 615,473

We have seen some piston rods so badly scored and so much out of line, that a third of the power of the engine or pump was lost. We used "Daniel's Patent P. P. P. Diagonal Rod Packing." It filled the scoring on account of its pliability, and enameled the rod surface until it was smooth as a glass bottle. Then the trouble stopped.

Hundreds of the biggest steam users in the country won't have anything else.

QUAKER CITY RUBBER CO., 409 Market St., Philadelphia, Pa.

(If you will examine a sample of "P. P. P."—and read a booklet—send in your name.) 27-14

GET THE RIGHT ANGLE

The easiest method of ascertaining the proper angle required in any work, is to use our

ANGLE INDICATOR, which can be used in connection with a universal bevel for transferring any given angle. It is as accurate as our Micrometer Protractor, in degrees, not made in minutes. Nicely graduated from 0 to 90, and well finished. Every mechanic, carpenter, machinist, toolmaker, cabinetmaker, draughtsman and tinsmith should own one. It is an indispensable tool to all using angles. Can be used for lathe work without the bevel. Price \$1. J. Stevens Arms & Tool Co., Chicopee Falls, Mass., U.S.A.

HIGH GRADE WORKING MACHINERY

Single Machines or Complete Equipments for Any Class of Work. Your Correspondence is Solicited. Illustrated Matter and Prices on application. J. A. FAY & CO. 10-30 John St., CINCINNATI, OHIO

Manufacturers' Models

of every description made to order with promptness, precision and economy. Models of Typewriters, Typewriting Machines, Cash Registers, Cyclometers, Revolution Counters, etc., in fact, any kind of model made from designs. Also special tools and machinery for any and every purpose. Correspondence invited from those intending to equip a plant. Illustrated circular free.

The Pratt & Whitney Co., Hartford, Conn.

Hold Your Scarf

with the Improved Washburne Patent Scarf Fastener. Also illustrated interesting papers or any articles, 10 cents each, by mail. Hose Supporters that do not bind the leg nor injure the fabric. By mail, 20 cents a pair. Illustrated Catalogue of these and other novelties, free. AMERICAN RING CO. Box P. Waterbury, Conn.

A TIGHT GRIP.

THE SKINNER PATENT DRILL CHUCK is simple, strong, and accurate. The jaws are of hardened tool steel. Stands self-test. It is self-centering, self-tightening, most durable. Holds straight or taper shank drills. Send for catalogue. SKINNER CHUCK CO., Church St., New Britain, Conn

ACETYLENE GAS AND CARBIDE OF Calcium.—All about the new illumina t. its qualities, chemistry, pressure of liquefaction, its probable future, experiments performed with it. A most valuable series of articles, giving in complete form the particulars of this subject. Details of furnaces for making the carbide, gas generators, gaometers, burners, etc. Contained in SCIENTIFIC AMERICAN SUPPLEMENT, Nos. 948, 1004, 1007, 1012, 1014, 1015, 1016, 1022, 1035, 1038, 1057, 1064, 1071, 1072, 1082, 1083, 1084, 1085, 1086, 1104, 1124, 1132, 1149 and 1150. Price 10 cents each, by mail, from this office, and all newsdealers.

Oster Pat. Adjustable Stocks & Dies

They are light in weight, dies made of the best tool steel, guaranteed just as strong and reliable as solid dies, cut the thread at one operation and release from the work without running back over finished threads. Each set of dies cuts two distinct sizes. THE OSTER MFG. CO. 85 Prospect Ave. Cleveland, Ohio, U.S.A.

Acetylene Gas Lighting

Reduced to the most Efficient, Safest, and Economical use. We claim for the NIAGARA the only Machine entirely Automatic in its action. Standard sizes from 10 to 150 lights. Larger sizes manufactured promptly to order. Licenses granted for use in unoccupied territory. Correspond with NIAGARA FALLS ACETYLENE GAS MACHINE CO., Niagara Falls, N. Y. and Canada.
