AIR BUBBLES.

It is greatly to be regretted that the inception of such a great industry as that of the automobile carriage in this country should be hampered by the sensational methods adopted by some of its so-called promoters. We refer to the omnipresent Autotruck Company, which, under the magic spell of certain names notorious in the more spicy periods of the political history of our city, still continues to enlarge on paper the sphere of its proposed operations. We have scarcely had time to grow familiar with the Air Power and Autotruck companies, with their capitalization of \$10,000,000 or more, and their intention to "control the trucking interests" of the city, before we are told that "Richard Croker is about to cross swords with the 'Third Avenue Railroad Company by fitting out a line of omnibuses driven by compressed air," etc. It is also added incidentally that "the Autotruck Company proposes to run stages similar to those proposed for Fifth Avenue, in Chicago and in Los Angeles, Cal.," yet we doubt if anyone has yet seen a street autotruck, and even the company cannot say more than that "orders for the construction of these vehicles have been given."

LIMITATIONS OF THE AUTOTRUCK.

We think it is extremely unlikely that the autotruck. if it should ever get beyond the precincts of Wall Street, will succeed in displacing entirely the horse-drawn truck. For certain conditions of our city trucking it would be an immediate and absolute failure; as for instance, in a snowstorm like the last, in which Mr. Croker's autotrucks would be even more helpless than Mr. Vreeland's trolley cars have proved to be.

that the measure of its tractive force would be deter- forms a very small and rapidly diminishing proportion mined by the adhesion of the driving wheels, and in of the total tonnage. In fact, it is probable that by the greasy condition of the streets on which heavy the time either canal is finished, the tramp steamer hauling is done, the adhesion would be very small in- will have completely ousted the sailing ship from the deed. If a 5-ton autotruck attempted to cross the well long distance carrying trade. lubricated paving of West Street or Water Street with a full load, not all the \$10,000,000 of vaporous capital of the most important questions for consideration. In the air company, if put into the motors, could budge view of the ever-increasing length of ocean steamships, it an inch.

of the multitudinous holes with which the Metropolitan Street Traction Company, having got in its wires, their radius should be large. When a large ship passes has strewn our thoroughfares, it would stay there until the discarded horse could be brought around to drag its discredited competitor from the pit.

ELECTRICITY AS A THAWING AGENT.

houses that are burned down every winter, as the result of attempts to thaw out frozen pipes by the perilous methods ordinarily practiced by the householder, the results would be decidedly sensational. To Prof. R. W. Wood, of the University of Wisconsin, great credit is due for showing that a frozen water pipe may The approximate curvature of the river channel shows posed to reduce a single battery from five to four guns be thawed out by the expedient of running through it a total length of curvature in the valley of 396 miles. an electric current of the proper strength.

would be a source of danger. The current used would not have to be as large as might be supposed, the coefficient of electrical resistance being, for instance, twelve times as great for lead as for copper. With proper precautions the process is not dangerous, and the saving in the way of excavation and plumbing will be very considerable.

COST OF THE BOSTON SUBWAY.

would cost more than the estimates. The work would is superior in practically every respect. all beof a kind with which engineers are familiar, and, indeed, if the funds for construction were furnished as fast as the engineers could use them, and a big force of labor were engaged simultaneously along, the whole route, we think it is likely that the tunnel could be

COMPARATIVE MERITS OF THE PANAMA AND NICARAGUA CANALS.

In our recent comparison of the advantages and disfect upon the commercial success of the canals, should lead. both be built. We refer to the question of favorable winds as affecting the amount of sailing tonnage that would seek either route, and to the yet more serious to reach either terminus without the assistance of tugs The weak spot in the autotruck would lie in the fact for the reason that t e deep sea sailing tonnage

In laying out a ship canal, the curvature is one of it is desirable to make the canal as straight as possi-If the driving wheels should chance to drop into one ble. If, owing to the nature of the country, curves are necessary, they should be "easy," that is to say, up the Manchester Ship Canal, she has to be assisted by a tug at her head and one at the stern to enable of risk. The smallest curve at Panama will be four times as easy as that of the Manchester Canal in Eng-If the statistics were gathered of the number of land, and double as easy as those of the Kiel Canal in Germany.

The curvature of the Nicaragua Canal has not been the San Juan Valley it must necessarily bevery sharp, even after the waters of the river have been dammed. The curves of the Panama Canal are of 8,200 feet radius In the present case a stretch of 300 feet of pipe be- or over, while the river channel at Nicaragua has six

immediate overheating due to the reduced area which brought out the welcome fact that a masonry structure can be built for a moderate increase of cost over one of timber. The cost of the dock will be about \$1,000,000 whereas the timber dry dock (known as No. 3) at the Brooklyn navy yard cost between \$600,000 and \$700,000, and in the two years of its existence it has cost for repairs \$171,000.

Prof. W. L. Cathcart, of Columbia University, in a paper on the subject read before the American Society of Civil Engineers, gives some significant figures re-The figures of the cost of the Boston Subway, as garding the cost of repairs on the two types of docks, given in the fourth annual report of the Boston Tran- in which it is shown that the least average annual exsit Commission, are very gratifying to the friends of penditure for repairs and maintenance was \$230 per the proposed rapid transit tunnel in New York. It year for the stone dock at Mare Island, while the was estimated in 1894, before work was begun, that highest expenditure was that upon the Brooklyn navy the cost of the subway would be \$5,000,000. Now that yard wooden dock, above mentioned, which averaged the work is completed, a close estimate places the total \$85,500 per year. A comparison of three stone docks, cost at \$4.250,000, exclusive of the cost of certain altera-, those at Boston, Norfolk, and Mare Island, shows an tions called for by legislation in 1897. It is not often average yearly expenditure of \$1,558, while the average that engineering works cost less than the estimate, and on four timber docks at New York, League Island, we do not call to mind any case where works of this Norfolk, and Port Royal, was \$13,364. Commodore magnitude have not somewhat exceeded the estimate. THE FASTEST VESSEL AFLOAT.

Until the new and large torpedo boats of the "Turbinia" type, now building at Newcastle, England, have been completed, the credit of having turned out built for something less than the estimate of \$30,000,000. the fastest vessel will belong to a German yard. The "Hai Lung," built by Schichau, of Elbing, for the Chinese navy, is credited with having made a run of 181/2 knots at an average speed of over 35 knots an

hour. The builder states that the highest speed realizadvantages of operation in the two proposed canals ed during the run was 36.7 knots or 42.26 miles per across the isthmus, we omitted to draw attention to hour. The best run of the "Turbinia" for a mile is one or two features which would have more or less ef- 35 knots, so that the Schichau vessel has a substantial

The most remarkable feature of this boat next to her speed is the fact that she is fitted with reciprocating engines. At the time the "Turbinia" made her question of the curvature of the canals as affecting phenomenal speed, it was popularly supposed that it both steam and sailing vessels. It is in favor of was entirely due to her new form of motor. In great Nicaragua that for ten months of the year there are part no doubt it was; but there is reason to believe steady trade winds, which would enable sailing ships that the excellent steam-raising qualities of her boiler contributed in no little degree to the result. Reexcept in entering the artificial harbors. In the lati- latively considered, the performance of the "Turbinia" tude of Panama, on the other hand, there are long was more meritorious, for the reason that she is only a periods of calm which might render somewhat lengthy 40 ton craft, while the Schichau boat is of 180 tons distowing necessary. While the objection counts for placement, or four and one-half times larger. The something, it is not so serious as might be supposed, new and enlarged "Turbinias" will be full sized torpedo boats, and for this reason it is likely that they will surpass the "Hai Lung" by a considerable margin of speed. Just what the excess will be is a matter which is exciting much speculation in naval quarters.

FLASHLESS RAPID-FIRE GUNS.

It is reported that the new French rapid-fire gun invented by Colonel Humbert gives no flash or sign of fire. If this be true, the French have made an advance in artillery second only in importance to that which marked the introduction by them of smokeless powder. In the operations around Santiago, the only means by which our men could locate the position of an enemy's piece was the flash. If this should be removed, the art of war, especially on land, will become her to make the turns. This is tedious, costly and full more difficult than ever, for a masked battery of smokeless and flashless guns would be positively undiscoverable. The only description of the gun that has come to hand is rather obscure ; but it would seem that an attempt is made to cool the larger portion of the gases below their flash point before they are allowed determined, but for about 50 miles of its course down to reach the open air. The rate of fire has reached a maximum of twenty shots per minute. To accommodate the increased expenditure of ammunition it is proand increase the number of ammunition wagons.

RAILS AND TIE-PLATES.

increased, it became excessive.

and by way of the frozen pipe to the connection in the hills, to reduce the curvature to the extent necessary cellar. It was only necessary to heat the pipe to sixty for easy navigation. degrees, and it is stated that within twenty minutes there was a full head of water in the cellar. The apparatus employed was planned by Prof. Jackson, and is being used with great success, two houses at a time being relieved thereby from their water famine.

It is evident that while electric thawing avoids the obvious risks of thawing out by hot coalsor similar applications of heat, it has dangers of its own, and should only be applied by an expert workman. The theory of electric thawing is that the current in flowing through the metal meets with a resistance which raises the temperature of the pipe. The temperature will depend, other things being equal, upon the sectional area of the pipe, and care should be taken that there is no considerable reduction of the size of pipe at any point between the electric terminals, since there would be an
