edge of electrical matters, he can easily determine how a rod ought to be put up. The most or the ocean. It is the case with sound important points to be attended to are tight waves. Two persons can talk at the same time joints and a good earth connection at the in the same room and be heard by others. A as in water and steam pipes. A small iron Perfect harmony will result. We see no reaand 1-16 inch thick. There is no need to go are, should be mixed or confused by existing in to the expense of a copper rod. Iron is by the same space together. 2. When two moving The grounding of the rod must be attended to rush together just before they meet? A. We with great care. The lower end of the rod would try to explain this if we thought the of iron or a coil of the rod itself should be shadows move any faster as they come near connected to the end of the rod to insure good each other than they did when further apart. contact between the rod and the earth. Rods 3. Is it a fact that food will sour more quickly building, and go to the peaks of the gables and warm? If so, please explain. A. We do not along the ridges of the roof, up chimneys, pinnacles and towers, to all the highest points rods above the roof and chimneys, such as are very often seen in the older practice of putting up lightning rods. Lightning rods are not tor has been heated, and not because hot food put up to invite the lightning to come down was put in. 4. Why is it that milk sours in that way, but to take care of it, if it insists upon coming. Rods should be fastened to the metal of roofs, gutters, and leaders, and should not be insulated from the house by glass in- refer me to some book describing fully transsulators as was formerly the universal method. formers made to transform a two-phase to a Such insulation is useless, since a quarter inch i of glass cannot hold back a discharge which has already jumped through perhaps a mile of air. Short points may be put upon the rod at all the higher parts of the building, not more than a foot above the building, but these are not necessary. The idea that a tall rod protects a certain area around its base is no longer considered true. The rod if solid should work out what you need. not be more than a half inch thick. If it is a tube it may weigh about as much per foot as if it were solid. Heavy telegraph wire if put up plentifully would be as serviceable as a rod. A building well netted over with such wire, better galvanized for durability, would be as thoroughly protected as with the most expensive rod. Remember that surface of metal is what is wanted in a rod rather than weight. In many respects a heavy rod is inferior to a light one of greater surface. Continuity of the metal is the most important feature. There must be no air gaps, no loose joints. It will thus be seen that a blacksmith with a little gumption is just as well able to do the work of making and putting up a rod as the best engineer. Much valuable information upon this subject has been printed each year in these columns. You should also have Supplements, Nos. 249, 348, and 998, price ten cents each. We append the rules given by Prof. S. P. Thompson as a summary of the modern views upon this subject. It will be noted that our advice given above differs slightly in some unimportant particulars from these rules. 1. All parts of a lightning conductor should be of one and the same metal, avoiding joints as far as possible, and with as few sharp bends and corners as may be. 2. The use of copper for lightning rods is a needless extravagance. Iron is far better. Ribbon is slightly better than round rod; but ordinary galvanized iron telegraph wire is good enough. 3. The conductor should terminate not merely at the highest point of a building, but be carried to all high points. It is unwise to erect very tall pointed rods projecting several feet above the roof. 4. A good deep wet earth should be provided, independent of gas or water pipes, to which the conductor should be led down. 5. If in any part the conductor goes near a gas or water pipe it is better to mean the working of an individual telephone, connect them metallically than to leave them but the methods for connecting and working apart. 6. In ordinary buildings the conductor should be insulated away from the walls, so as to lessen liability of lateral discharge to metal \$3 by mail. It is very full and complete. Anstoves and things inside the house. 7. Connect other important work is Hopkins's "Telephone all external metal work, zinc spouts, iron crest ornaments and the like, to each other and to the earth, but not to the lightning conductor. 8. The cheapest way of protecting an ordinary house is to run common galvanized iron telegraph wire up all the corners, along all the ridges and eaves, and over all the chimneys, taking them down to the earth in several places to a moist stratum, and at each place (Not long-distance.) What strength suffices for burying a load of coke. 9. Over the tops of ordinary speaking current? A. The current arch of the lightning conductor made of any transmitters. It is very minute with all. Prof. tect his home from a stroke of lightning.

(8301) F. R. M. asks: 1. When light rays cross each other or reflect back upon themselves as they are made to do in diagrams of images formed by lenses and mirrors, why do they not become mixed up and produce interference? A. They do not become mixed up, but do interfere when the reflection is at a suitable angle. It is in this way that the fact that light is due to a wave motion was demonstrated by Fresnel. These interferences cannot be seen in the open, but require a dark room and special arrangements. They can be seen by placing the hand over the eye so that you can look at a bright light, such as an open window will furnish in a clear day. You will then see innumerable dark lines in the space between two fingers, parallel to the fingers. These are interference lines. The waves do not become mixed up, because any number of

little instruction; but if one has some knowl- same space as if no other wave were there. bottom of the rod. The parts of the rod whole orchestra can play at the same time and should be screwed together with couplings, no jumble or mixture of the sound result. water pipe would make a good lightning rod; son why light waves which are not vibrations so would a flat strip of iron one inch wide of ordinary matter, as these other vibrations many considered really better than copper. shadows approach each other, why do they must be in water or in moist earth. A plate question stated a fact. We do not think two should be carried up at all the corners of the if put into a refrigerator while still quite think so. The reason a hot dish should not be put into a refrigerator is that it heats the of the building, but there should not be high air and destroys the work the ice has already done. In the hot refrigerator food will then spoil. This is because the air of the refrigeraa thunderstorm? A. We do not know

> (8302) C. W. R. asks: Will you please three-phase current or vice versa? A. We presume you wish to find the plans from which you can make the transformer you require. We do not know any published plans of this sort. There are good books upon the theory of the transformer. Such is Kapp's, price \$1.75 by mail; Adams's "Transformer Design," price \$1.50 by mail. By the aid of these you might

(8303) F. W. writes: I have a small motor which runs a fair speed when using 4 size wire must I use on the field and armature? A. There is probably not room for the wire to rewind the motor for 110 volts. The better way is to put the motor in series with two 16-candle lamps. It will then get 1/4 ampere and a few volts.

(8304) G. O. S. writes: During a thunder shower here it was said that some of the sulator. stitchers using sewing machines run by an electric motor connected to the shafting by a 10 or 15 foot leather belt experienced a sensation like that of one's feet going to sleep. Is it possible that they felt a slight shock? It is possible that they felt a slight shock? not dangerous to run the motor during a thun-der shower, is it? The power is furnished by the Edison Company. A. Anything is possible with the lightning, but it is not apparent from your description that anything happened. The sensation may have been from electricity, and again it may have been from nervousness, No one can tell. A quiet mind would eliminate one No electric disturbance is likely to have passed to the sewing machine. If the Edison wires are underground they are not likely to receive a arresters are used there is little likelihood of the electricity of the lightning entering a building. If your installation is properly made there should not be any special risk at the sewing machines during a thunderstorm.

(8305) W. S. P. asks: 1. What are the modern works upon the telephone? I don't them. A. The best work upon this subject is Miller's "American Telephone Practice," price Lines and Their Properties," price \$1.50 by mail. With these two you have a very complete presentation of the whole subject. Of smaller books there are . Webb's "Telephone Handbook," price \$1, and Poole's "Practical Telephone Handbook," price \$1.50 by mail. 2. What are the strengths of the several currents used in the local call bell? A. Magneto call bells are book. wound to 300 to 500 ohms for local work; for bridged work much higher, to 10,000 ohms even. dinarily by hand is from 65 to 75 volts. As the current is alternating, the amperes are less

(8306) L. A. F. asks: Is there an eslight hulb or lamp is removed from its holder when the current is on? Will the meter register it? A. If a socket is in good condition there ought not to be any leakage when the

(8307) J. M. asks: 1. If a stone is dropped into the ocean at a very deep part, will the stone sink to the bottom or will it remain above the bottom and float in the water? I heard some people say that the pressure was so great that the stone could not sink. A. Anything which begins to sink in the water of the ocean will continue to sink till it reaches the bottom underneath it. The pressure is very great. At 24,000 feet it is four tons per square inch, and at the greatest depths of the ocean it is about five tons per square inch. This will compress any article which sinks to that depth very greatly and render it much heavier relatively to the water; but the water is not compressed to any degre by even that great pressure. So that the article which is sinking and being compressed is all the time growing heavier relatively to the water and will sink faster the farther it sinks. 2. Has a cannon on board of a man-ofwar a device to make it rebound, or is the cannon fastened to the ship? A. The old method was to allow the gun to run back by its recoil so as to load it again. All modern guns are breechloaders and do not run back by their recoil. The force of the recoil is taken up by a liquid pressure, some liquid such as glycerine being used.

(8308) Farmer asks: Will you kindly tell me through your paper whether lightning rods secured to buildings with malleable iron brackets are a protection against lightning? It would appear to me that the rods should be insulated at all points where they come in contact or are secured to the building or they must be more dangerous than otherwise. A. Opinions differ upon this point. Equally good authorities are to be found upon both sides of the question. We are personally inclined to the opinion that a lightning red may just as well be connected to the house directly as volts and 1/4 ampere. I would like to run the motor on a 110-volt light circuit. What opinion are that the glass will be wet as soon as rain falls and its insulating value will be greatly reduced; and the electric discharge, which has already leaped through thousands of feet of air between the cloud and the earth. will not mind the few inches of air through which it must pass in going from the rod to the iron support of the rod around the in-

> (8309) A. S. asks: How many units of heat for a stated weight of the metals sodium and potassium are evolved in passing to the condition of KOH and NaOH respectively? A. When one gramme of potassium combines with oxygen there are 1,745 units of heat produced. When one gramme of sodium combines with oxygen 3,293 units of heat are produced. We have no separate data for the change from the oxide to the hydrate.

(8310) J. C. M. writes: I have a son 15 years old who wants to learn all about eleccause of unpleasant sersation at such a time. tricity and electric instruments. You no doubt have such books on sale. I would like to have from the Edison wires through a leather belt catalogues of them, with your recommendation of such as you think most suitable for him. He wants a descriptive and practical work lightning discharge. Aerial wires are very often one that will give him complete instructions struck by lightning, but when suitable lightning | for making and repairing any part of any kind of electric or magnetic appliance. A. There is no work or set of books which can supply what is asked in this request. We presume the intention is to ask for books by means of which the lad can make a beginning of learning electricity. We can furnish Sloane's "Electrical Library" for \$5 by mail. There are also separate books to be had upon making telephones, putting in electrical bells, etc. After these might come the building of a small dynamo or motor, the making of a galvanometer and induction coil. These can be found in Bottone's "Electrical Instrument Making for Amateurs," price 50 cents.

> (8311) W. I. P. asks: Where can I get information on the subject of wave motion and the attempts to use it as a power? A. See Supplements, Nos. 536, 825, 861, price ten cents each, for articles describing various devices which have been employed to utilize fhe force of waves to do work.

(8312) H. R. asks: As to the electric motor described in "Experimental Science." Do you sell it or its parts? A. We do not stout and durable metal. Any man of intelli- Cross, of Boston, by employing very delicate sell any of the apparatus described in "Exgence can put up a lightning rod or wire from instruments and great refinement of method, perimental Science" or the parts of any of it. these simple rules, and may then feel assured reached the following results: The current in The object of the book is to stimulate ingenious that he has done all that can be done to prote the secondary wire of the induction coil of persons to "make things" by showing them how the Edison transmitter, 0.072 milliampere; of to proceed. This object it is accomplishing. the Blake transmitter. 0.132 milliampere: of There is no book so well adapted to help one the Hunnings transmitter, 0.556 milliampere to build suitable and sufficient apparatus for 3. What for the magneto-electric that rings studying science within its limits as is this

(8313) F. R. asks: What book or paper gives information on the Marconi wireless tele-The E. M. F. of the magneto when run as or- graphy. I wish a description of instruments and operation of same. Can such instruments be made in an ordinary machine or model makthan the quotient of the volts by the ohms; ing shop. A. Fahle's "History of Wireless Telesmall. We have no exact data upon the of the roder. vented, Marconi's among the rest. We have published several papers on the subject, but cape or loss of electric fluid if the electric none which gives details of construction such as would enable a man to build a copy of the apparatus. Moreover, Mr. Marconi is changing his apparatus continually as the results of his experiments, and no description is up-to-date Sets of waves can pass at once through the lamp is removed. If, however, there is leak-upon the subject. There is nothing about the

age the meter will register the current which apparatus which could not be built in any ordinary shop.

#### TO INVENTORS.

An experience of over fifty years, and the preparation of more than one hundred thousand applications for patents, at home and abroad, enable us to understand the laws and practice on both continents, and to possess unequaled facilities for procuring patents everywhere. A synopsis of the patent laws of the United States and all foreign countries may be had on application, and persons contemplating the securing of patents, either at home or abroad, are invited to write to this office for prices, which are low, in accordance with the times and our extensive facilities for conducting the business. Address MUNN & CO., office Scientific American, 361 Broadway, New York.

### For Heavy Continuous Work

every machine shop will commend our Power Pipe Threading and Cutting Machine. Cones are central over machine, equalizing the weight. Within the cones are compound gears giving six changes of speed. Gears require no extra space, and are protected from dust or accident. Chasers can be opened, threaded pipe removed, another inserted and cut without stopping machine. \*\* Send for Catalogue.\*\* THE MERRETI. METERETIA.
