would have seemed just at hand. Many of power, but when heavy machinery is connected Dissolve the vanillin in the alcohol and add the to. The contents of solid substances in the be seen in our museums.

(9788) L. E. S. asks: 1. Increase in ber of ohms resistance, in the telegraphic relay. Why is this? A. A greater distance requires a finer wire on a telegraphic relay in order to secure a greater number of turns of wire in the same space, so that the magnetizing power of the current may be as great as The increase in the number of turns of wire is more important than the increase of resistance due to the finer wire. Why is the glass front in the search light divided into vertical strips of glass? A. The glass in the front of a search light is divided into strips to reduce the loss if a crack is made by the heat. These need not be vertical. 3. A telegraphic cable crossing the ocean is The broken place is some distance from shore. How can the distance from shore to the end of the broken cable be ascertained? What instrument is used? A. The distance to a break in a cable is determined by measuring the resistance of the cable to the break. at which point the wires are grounded, and hence have no resistance. Since the resistance per mile is already known, it is easy to calculate the distance to the break by dividing the measured resistance to the break by the resistance per mile. 4. What is the greatest number of volts that have been passed through the human body without harm? A. Volts are not passed anywhere in an electric circuit. Volts are the pressure which makes the amperes $\mathbf{fl} \bullet \mathbf{w}, \ \mathbf{and} \ \mathbf{amperes} \ \mathbf{do} \ \mathbf{the} \ \mathbf{harm} \ \mathbf{to} \ \mathbf{the}$ person who receives the current. If the current has a high voltage, the shock is more severe. Men have received shocks from circuits with 2,500 volts on them without special harm, and again men have been killed when the voltage is only 500. The effect depends upon something more important than volts; that is, upon the resistance of the man who receives the shock. This is affected by the moisture or dryness of his skin and clething, and to an extent perhaps upon his nervous condition. It depends also upon the time which the current acts upon the man. This answer relates to commercial circuits and heavy currents. When the current is that of an induction coil or high-tension transformer, such as Mr. Tesla used in his famous experiments, a million or more volts seem to be without any perceptible effect. A man may hold an incandescent lamp bulb in his hand, and the sparks fly for a long distance through the air to the lamp and light it to full candle power, while he feels nothing of the current which is passing through him. Your question then does not admit of a categorical answer.

(9789) C. P. P. asks: Will you kindly answer the following question through the strain into the other portion. Strong bettles column of notes and queries in your valuable are very essential, champagne bottles being frepaper: Which succeeds the other, day or quently used, and the corks should fit very night? A. In our calendar the day begins at midnight and the morning precedes the afteris, day succeeds night and night succeeds day in ceaseless round.

(9790) H. M. asks: 1. Could not the core of an induction coil be made longer and the secondary coil be placed beside the primary coil and not over it, and thus save considerable properly finished, the bottles are to be gently length of wire, and also number of turns of shaken each day for about ten minutes to prewire in secondary? A. Induction coils have vent the clotting of casein. It is as well to been made with almost every possible relation take the precaution of rolling a cloth around of the various parts, with the result that it is the bottle during the shaking process, as the a general agreement of experimenters that the amount of gas generated is great, and should usual mode of arranging is the best. The the bottom be of thin glass or contain a flaw secondary coil is sometimes placed by the side it may give way. Some few days clapse before of the primary in the transforming of alternation passes into the acid stage, and ing cirrents for lighting, but then the core is especially designed to save the lines of force. much thicker. It is now in the proper con-In coils for giving sparks the core should not dition to be used .- Pharmaceutical Era. be unnecessarily long, since the object is to secure as sudden a demagnetization of the core as possible. You would better conform to the proportions of coils as given in the best books. Take Norrie's "Induction Coils," for a guide. We can furnish it for \$1. 2. Do the outer coils of the $\mathtt{sec} \bullet \mathtt{nd} \mathtt{ary}$ \mathtt{add} as much strength to the coil as do the turns of wire wound nearest the core? A. The outer turns of secondary wire have not the same value in producing current as do the turns near the primary. The mode of securing a small-sized secondary is to use of securing a small-sized secondary is to use the finest possible wire. No. 36 to 40 is employed. 3. How is the magnetic resistance of paste is suitable for almost any kind of labels, a piece of iron calculated? If I know the a piece of iron calculated? If I know the ampere turns how may I know the strength of the magnet? A. The magnetic resistance, me a formula for library paste. A. A good or reluctance, as it is called, is equal to the white library paste may be made by any of length of the circuit divided by the product the following processes: 1. Water, 1 quart: of the permeability by the area of cross section alum, 34 ounce. Dissolve and add enough flour of the iron. The tractive power of a magnet to bring to the consistence of cream, and then in pounds is found by the formula.

$$Pounds = \frac{TC \cdot M \cdot \sqrt{A}}{2661 L}$$

in which TC is the ampere turns, M is the permeability, A is the area of cross section drachms; water, $\frac{1}{2}$ pint. Heat with constant of poles, and L is the mean length of magnetic stirring, until the milky liquid becomes thick circuit. 4. What voltage will a five-bar telephone generator furnish? A. The ordinary telephone generator will give from 65 to 75 a little oil of cloves, or carbolic acid, salicylic volts. What a five-bar generator gives we are not able to say. 5. Why is it that a generator requires more power to turn its armature when delivering heavy current than when on gist, of St. Louis, has published the following open circuit? A. The generator requires more power to drive its armature when it is deliver-

these bodies have fallen to the earth, and may to it, it requires much steam to drive it. 6. ('an you give me the formula for constructing a tangent galvanometer so that certain degrees distance requires finer wire, or a greater num deflection will equal certain value of current? A. A deflection of a certain number of degrees always represents the same current in a given tangent galvanometer. You do not require any special formula to determine the current for any deflection. Use the ordinary formula for the tangent galvanometer, and substitute the natural tangents for tangent a in the formula. Calculate the corresponding current in each case. Form a table of these currents for each angle, and keep it for reference. You will then save the trouble and labor of making the To the residue in the vessel add one-half of calculation for each reading; we mail you a the remaining alcohol and water, and treat in copy of our Supplement Catalogue, in which you will find mention of articles on the construction of galvanometers.

(9791) F. C. B. asks for a padding paste. A. Glue, 4 pounds; glycerine, 2 pounds; linseed oil, 1/2 pound; sugar, 1/4 pound; aniline dye, q. s. The glue is softened by soaking it in a little cold water, then dissolved together with the sugar in the glycerine by aid of heat over a water bath. To this the dye is added, after which the oil is well stirred in. It is used het. Another composition of a somewhat similar nature is prepared as follows: Glue, 1 pound; glycerine, 4 ounces; glucese sirup about, 1 ounce; tannin, 48 grains. Give the compositions an hour or more in which to dry or set before cutting or handling the pads.

(9792) A. G. H. asks how to restore crape. A. Black crape may be freshened and made to look almost equal to new if treated in the following way: Lay over the ironing table a piece of black cambric or cloth of any kind, and pin the piece of crape smoothly through to the blanket, stretching it out to its •riginal size. Wring another piece of black cambric out of water and lay it over the crape, patting it down with the palm of the hand. Now take hot flatirons and pass them over the wet cloth, letting them just touch the cloth, but allowing no pressure to come upon the crape. When the cloth has become dry from the heat of the iron remove it, but let the crape remain pinned down until all the moisture has evaporated and it is perfectly dry. The crape will now feel and look like new. long veil can be renovated in this way, making dilute sufficiently with oil of turpentine to sure that the part redressed comes under the edge of the wet cloth.

(9793) F. J. H. asks how to make koumyss. A. Fresh milk, 12 ounces; water, 4 ounces: brown sugar, 21/4 drachms: compressed yeast, 24 grains; milk sugar, 3 drachms. Dissolve the milk sugar in the water, add to the milk, rub the yeast and brown sugar down in a mertar with a little of the mixture, then ght and the morning precedes the after a bottling machine for the purpose, and once The answer to your question, however, the cork is properly fixed it should be wired down. Many failures have resulted because the corks did not fit properly, the result being that the carbonic gas escaped as formed and left a worthless preparation. It is further necessary to keep the preparation at a moderate temperature, and to insure the article being when this has taken place the preparation is

> (9794) J. H. P. asks how to paste labels on cork. A. Gum tragacanth, 1 ounce; gum arabic, 4 ounces. Dissolve in water, 1 pint; strain, and add thymol, 14 grains, suspended in glycerine, 4 ounces; finally add water to make 2 pints. (2) Rye flour, 4 ounces; water, 1 pint; nitric acid, 1 drachm; carbolic acid, 10 minims; oil of cloves, 10 minims; glycerine, 1 ounce. Mix the flour and water, strain through cheese cloth, and add the nitric acid. Apply heat until suitably thickened, and

(9795) F. J. C. says: bring it to a boil, stirring all the time. Starch, 2 drachms; sugar, 1 ounce; acacia, 2 drachms; water, sufficient. Dissolve the gum, add the sugar, and boil until the starch is cooked. 3. Rice starch, 1 ounce; gelatin, 3 stirring, until the milky liquid becomes thick and glassy, when the paste is ready for use. Any of these pastes may be preserved by adding acid, or formaldehyde.

(9796) W. B. K. asks for information concerning vanilla extract. The National Drugformulas for preparing three grades of vanilla essences, translated from the Zeitschrift für

240 parts; alcohol, 720 parts. Mix the vanilla. cut fine, the musk and potassium salt, and pour over them the boiling water. Let them and filter the percolate. III. Vanilla in fine the benzine. bits, 250 parts; alcohol, 2,500 parts; water, (9801) 1,500 parts. Mix the alcohel and water and pour one-third of the mixture over the cut beans. Put into a vessel with a tight cover. place in the water bath and keep for one hour at 60 deg. C. Pour off the liquid and set aside. the same manner. Repeat the $\bullet \mathrm{peration}$ with the remainder of the liquid. Remove the vanilla to an extraction apparatus, pack and extract with 250 parts of alcohol and water mixed in the proportion indicated above. Mix the results of the three infusions, filter, and wash the filter with the result of the percolation, allowing the percelate to run through and mingle with the original filtrate. To prepare a sirup with either of these essences, mix 15 parts of the essence, 8 parts of caramel solution, and 4,500 parts of the sirup, in which 15 parts of gelatin have been previously dissolved by the aid of gentle heat.

(9797) E. G. asks: I would like to receive information on the fellowing subject through the columns of your paper. Does it make any difference how the contact is broken on a jump spark coil, that is, will it make any difference in the secondary spark? A. The mechanism for breaking contact in the primary coil does not make much difference to the spark provided the break is made suddenly.

(9798) C. L. T. asks for a formula for japanner's gold size. A. Gum animi and asphaltum, each 1 ounce; red lead, yellow litharge and umber, each 146 ounces. Reduce to a fine powder, mix and put them with a pound of linseed oil into a pipkin, and boil gently, constantly stirring until theroughly incorporated. Continue the boiling until it becomes as thick as tar, as it cools. Strain through fiarnel, and keep for use, carefully stopped up. When wanted, grind with as much vermilion as will give it an opaqueness, and work freely with a pencil. Or, take linseed oil, 1 pound; gum animi, 4 ounces. Boil the oil, Modern Electrical Construction. and add gradually the gum animi finely powdered, until dissolved. Let the mixture boil to the consistence of tar on cooling, then strain while warm through a coarse cloth for use. Previous to being used, it must be mixed with vermilion and oil of turpentine, as above. This size may be used on almost any substance, and no preparation of the work is necessary, beyoud having an even and perfectly clean surface. To use the size, put a proper quantity prepared as above into a saucer. Then spread matter interspersed. The book is thoroughly it with a brush over the surface to be gilded, or draw with it, by means of a pencil, the designs intended, carefully avoiding to touch any other parts. Let it remain until fit to receive the gold, which is to be determined in the same manner as in oil gilding, by the finger. Then go over the work with a soft camel's hair pencil. The whole being covered, it must be left to dry, and then the loose powder lightly brushed off. When gold leaf is used, the method of sizing is the same, but the operation requires more nicety. There are various sorts of gold powders-pure gold powder, Dutch, mosaic, etc., any of which can be procured at the artistis' color shops ready for use. When the whole has been gilt, any parts uncovered may be repaired by wetting with a camel's hair pencil, and covering the part with gold, avoiding, as much as possible, touching the perfect gilding, as it frequently causes it to turn black.

(9799) A. L. B. asks how newspaper pictures can be transferred. A. Prepare a liquid by dissolving $1\frac{1}{2}$ drachms common yellow soap in 1 pint of hot water, adding, when nearly cold, 34 fluid ounces spirits turpentine, and shaking thoroughly together. This fluid is applied liberally to the surface of the printed matter with a soft brush or spenge (being sanitary camp. The book is very completely sanitary camp. comes softened) and allowed to soak for a few minutes; then well damp the plain paper on which the transfer is to be made, place it upon the engraving and subject the whole to moderate pressure for about one minute. On separating them a reversed transfer will be found on the paper.

(9800) J. B. C. asks for a benzine varnish and polish. A. Various kinds of resin can be carefully melted, according to the variety of the varnish or polish to be produced, in hermetically closed kettles under addition of beracic acid and, after cooling, moistened with methylic alcohol. The liquid gums thus treated are completely soluble in benzine. The following gums enter into use: White or yellow shellac, sandarac, mastic, Manila gum lac, stick lac, etc., either alone or mixed together, FARMER'S CYCLOPEDIA OF AGRICULTURE. according to whether the polish and varnish is to be light colored, yellow, or red, dull, or transparent. The percentage of boracic acid, gum, and methylic alcohol varies according to the quality of the resins employed and the destination of the varnish and polish, but in no case must the quantity of boracic acid exceed 5 per cent of the resin quantity em- by farmers and experimenters is greatly needed,

water. II. Musk, 1 part; potassium carbenate, varnishes should not be less than 15 per cent 1 part; vanilla beans, 60 parts; boiling water, and not less than 8 per cent in the polishes. According to the inventor, the benzine varnishes can not only entirely take the place of the spirit lacquers and polishes, but even afford the stand until quite cold, then add the alcohol and advantage of facilitating and accelerating the set aside for 14 days. Finally strain, express, work, on account of the quicker evaporation of

> (9801) C. L. asks for a formula for red paint used on magnets. A. The "paint" used on magnets is usually non-conducting shellac varnish, carrying cinnabar. Try the following formula: Cinnabar, pulverized, 3 parts; Venice turpentine, 2 parts; shellac, pale, 1 part; alcohol, 95 per cent, sufficent. Melt turpentine and shellac, remove from fire, let cool down to about 140 deg. F., and add $10\,$ parts of the alcohol. Rub up the cinnabar with sufficient alcohol to mix a paste, and add it to the melted mixture. Put on a water bath for a few minutes, and stir continuously, until a smooth, homogeneous fluid is obtained. Remove from fire, and stir until cold. Preserve in well-stoppered vials, and when desired for use return to the water bath, and heat until the liquid can be applied with a brush. The magnet should be warmed before applying.

NEW BOOKS, ETC.

DER EISEN-BETON UND SEINE ANWENDUNG IM BAUWESEN. Von Paul Christophe. Berlin, 1905. Verlag: Tonindustrie Zeitung. 916 illustrations. Pp. 575. Full morocco levant. Crown 8vo. Price, \$8.50.

Although originally published in 1902, it cannot be denied that the work before us is a most exhaustive and valuable contribution to a subject of ever-growing importance. Mr. Christophe's work is divided into five parts, in the chapters of each of which an enormous amount of material, which he was able to gather in his capacity of engineer, has been a $\bar{\textbf{d}}$ mirably distributed. In the first part, general principles and methods of construction are discussed. In the second, methods of application are treated. In the third, the preparation of material is discussed. The fourth division is devoted to theoretical considerations, and the fifth is a thorough review of the advantages and disadvantages of reinforced concrete.

Henry C. Horstman and Victor H. Drake & Co., 1905. 16mo.; pp. 345. Price, \$1.50.

This work is intended as a reliable and practical guide to the beginner in electrical construction. The rules of the National Electrical Code adopted by the National Board of Fire Underwriters are contained in full and practical and is well illustrated.

THE OUTLOOK OF NATURE. By L. H. Bailey. New York: The Macmillan Company, 1905. 8vo.; pp. 296. Price, \$1.25.

The contents of this volume consist of four lectures delivered last January at the Colonial Theater, Boston, as a part of the University course, under the auspices of the educational committee of the Twentieth Century Club. The lectures are on the following subjects: "The Realm of the Commonplace"; "City and Country"; "The School of the Future," and "Evolution: A Quest of Truth."

THE SANITATION OF A COUNTRY HOUSE.

By Dr. Harvey B. Bashore. New
York: John Wiley & Sons, 1905. 12mo.; pp. 102. Price, \$1.

This small volume contains many useful hints on the proper sanitation and beautifying of a country place. Its author has had a great deal of experience in his capacity of inspector for the State Board of Pennsylvania. Not only is the subject of sanitation and proper sanitary arrangements of a country house and its surroundings gone into, but the book also describes the proper method of constructing a illustrated by some fifteen half-tone plates. We recommend it most heartily to all dwellers in

PLANE AND SPHERICAL TRIGONOMETRY. BY P. A. Lambert and H. A. Foering. New York: The Macmillan Comnany 1905 12mo.; pp. 104. 60 cents.

The authors believe that this textbook will develop in the student the ability to think out and apply the relations between the trigonometric functions. Tables of the functions are not included in the book, as the authors consider it better that the student should use separate tables. The whole work is so arranged that it encourages the student to use his reasoning powers, not merely to memorize.

By Earley Vernon Wilcox, Ph.D., and Clarence Beaman Smith, M.S. New York: Orange Judd Company, 1904. Small 4to.; pp. 619, 477 illustrations. Price, \$3.50.

Believing that a digest of the results-for it is results that the farmer is after-obtained pleyed, and the proportion of methylic alcohol, the authors undertook the publication of this should not, even in case the hardest and most, work. The volume contains a large amount of ing current because it is then doing work. Kohlensaure Industrie: I. Vanillin, 20 parts; scarcely fusible gums are employed, make up valuable information which has been culled from An engine running free does not require much absolute alcohol, 600 parts; water, 450 parts. more than the weight of the resin amounts the rarming papers, the Bulletins of the Ameri-

can Agricultural Experiment Stations, and from work done in foreign stations, and by individuals, as well. The book treats fully of agricultural science and practice with regard to field, orchard, and garden crops, spraying, soils, the feeding and diseases of farm animals, dairy farming, and poultry raising in the United States and Canada. It is divided into eight main parts, which treat of Field Crops; Garden Crops; Fruits and Nuts; Cattle and Dairying; Live Stock; Poultry; Fertilizers, Soils, Drainage, and Irrigation; and Miscellaneous subjects. The cultural details of all common plants are given, and full directions are supplied for raising all sorts of crops. The various fungous diseases and insect pests that attack these crops are also fully described.

CLAY MODELING AND PLASTER CASTING Edited by Paul N. Hasluck. Philadelphia: David McKay, 1905. 12mo.; pp. 156. Price, 50 cents.

This is a very complete little handbook, that goes fully into the details of clay modeling. The tools and materials used are fully described and the various processes of molding are gone into in detail. A chapter on Modeling the Hu man Figure will no doubt be found useful to young sculptors. The book is a compilation of matter published in Work, and any further information not contained in its pages may be had by addressing the editor of that journal. why Europeans have always failed to colonize RELIGION AND LUST. By James Weir, Jr., M.D. Chicago: Chicago Medical Book Company, 1905. 8vo.; pp. 233.

Price, \$1.50. In the third edition of this monograph, the author has confined himself almost wholly to a discussion of the psychical correlation of religious emotion and sexual desire, having eliminated certain of the psychical problems embraced in the first two editions and added instead a bibliography. The book also contains considerable data additional to the thesis of the work, as well as foot notes. All notes and quotations found in the book have been carefully verified and edited. The author feels has never before been treated exhaustively, confident that the work gives the truth of the and popular scientific literature has generally subject as nearly as it is possible to ob-

PRACTICAL PLUMBERS' WORK. By Paul N. Hasluck. Philadelphia: David Mc-Kay, 1905. 12mo.; pp. 150. Price, \$1. David Mc-

This is a complete handbook for the practical plumber, containing, in a form convenient for every-day use, a comprehensive digest of information contributed by experienced craftsmen to the columns of the Building World. The information is concise and complete, and it is made doubly valuable by the large number of illustrations, of which there are 298.

MODEL SAILING YACHTS. Edited by Percival Marshall. London: Marshall & Co., 1905. Percival 12mo.; pp. 144. Price, 50 cents.

The volume forms the fourth of Marshall's Practical Manuals. It is a very complete handbook on the construction and sailing of small model sailing yachts. Besides containing use ful advice to the tyro on choosing and sailing his boat, the book contains more advanced information by experts-information which will be of benefit to the man who has had more experience in the construction of model yachts. THE BOOK OF THE AUTOMOBILE. By R. T.

Sloss. New York: D. Appleton & Co., 1905. 8vo.; pp. 372. Price, \$3. This is one of the most complete works on the automobile and its uses that has come to our notice. Starting in with the usual historical review, the author next discusses the various types of motors, transmissions, and various forms of chassis employed. Separate chapters are given to the various types of gasoline motors which have been and are now being manufactured; various types of automobile steam engines are discussed. A very helpful chapter is entitled "How to Choose an Automobile." The author goes into the cost of upkeep of various types of machines over a period of several years, besides other chapters on "How to Run an Automobile," "How to Care for an Automobile," and "The Automobile in Commerce and Sport." The book contains a chapter on touring, which is well illustrated and which has a map showing the 1904 St. Louis tour. A list of all the prominent American cars with full specifications will be found in the book which is completed by a suitable index and which has also a valuable glossary of English, French, and German terms.

THE ELEMENTS OF RAILWAY ECONOMICS By W. M. Ackworth, M.A. Oxford: The Clarendon Press, 1905. 12mo.; pp. 159. Price, 70 cents.

The author of this text book is well known by his previous works on the "Railways of England" and the "Railways and the Traders." In the present volume he considers railways and railway business from the economic point or view. The author discusses railway capital, expenditure, and income, as well as the everpresent question of railway rates. Although only a first installment of the complete work which the author had planned, this book will be found to go into the subject very thoroughly and to give considerable interesting informa

How to Know WILD FRUITS. By Maud Gridley Peterson, with illustrations by Mary Elizabeth Herbert. New York: The Macmillan Company, 1905. 8vo.; pp. 340. Price, \$1.50.

This book contains descriptions and draw-

ings of various wild fruits. The author dealt only with those plants which has bear attractively-colored fruits. These fruits are generally the more noticeable ones, and they do not develop until the blossoms entirely disappear. Each illustration is furnished with a description which tells the kind and structure of the fruit and which will thus aid in determining the family to which a plant belongs; while the arrangement is such that each family of a species is grouped by Approximately 200 plants found in England and America are described. The book is prefaced with a suitable guide to the plant families and species described in it.

EFFECTS OF TROPICAL LIGHT ON WHITE MEN. By Major Charles E. Woodruff, A.M., M.D., Surgeon in the United States Army. New York: The Red-man Company, 1905. 8vo.; pp. 358.

The author commenced the writing of this work in an attempt to prove or disprove the theory announced by Von Schmaedel in a paper before the Anthropological Society, Munich, during 1895, that skin pigmentation of man was evolved for the purpose of exclud ing the dangerous actinic, or short, rays of light which destroy living protoplasm. This theory gave, at once, the reasons for the evolution of nigrescence and blondness, the reasons in the tropics, and why blonds disappear when they migrate from their northern homes; and it finally gave rise to practical hygienic rules for white men compelled to reside in the tropics. As the suggestions contained in this paper were of such inestimable value provided the theory was correct, a systematic search was instituted for data; and the discoveries made in this search prove the correctness of the theory. In the present work Mr. Woodruff brings forth these discoveries and attempts to prove the theory conclusively. The subject, though a very interesting one and of great importance to all blonds in the United States, ignored the real issue. Among the headings of chapters in this work are the following Ether Waves, Their Action on Protoplasm; Difference Between Plants and Animals Natural Defenses of Animals from Light; Known Effects of Light on Man; Actino-Therapy; Evolution of Blondness; Results of Insufficient Pigmentation; and Practical Rules for White Men in the Tropics. An index puts the information contained in the book instantly at the reader's disposal.

INDEX OF INVENTIONS

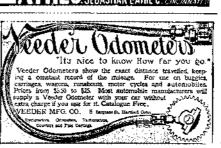

For which Letters Patent of the United States were Issued for the Week Ending September 19, 1905
